

GTA Aquifer Assessment 08-05

by David Thorkildsen, P.G. and Sarah Backhouse

Texas Water Development Board
Groundwater Technical Assistance Section
(512) 936-0871
October 22, 2009

REQUESTOR:

Caroline Runge, of the Menard County Underground Water District acting on behalf of the member groundwater conservation districts of Groundwater Management Area 7.

DESCRIPTION OF REQUEST:

In a letter dated July 8, 2008, Ms. Caroline Runge provided the Texas Water Development Board (TWDB) with draft desired future conditions for the Edwards-Trinity (Plateau) Aquifer covering two separate areas in Groundwater Management Area 7 and requested that TWDB estimate draft managed available groundwater values for each of those areas. This aquifer assessment presents the draft managed available groundwater for the Edwards-Trinity (Plateau) Aquifer in the Crockett County, Kimble County, Kinney County, Middle Pecos, and Wes-Tex Groundwater Conservation Districts; the Coke County, Hill Country, Sterling County, Sutton County, and Uvalde County Underground Water Conservation Districts; the Hickory Underground Water Conservation District No. 1; the Irion County and Lipan-Kickapoo Water Conservation Districts; the Menard County Underground Water District; the Plateau Underground Water Conservation and Supply District; and the Real-Edwards Conservation and Reclamation District in Groundwater Management Area 7.

DRAFT DESIRED FUTURE CONDITIONS:

- Edwards-Trinity (Plateau) Aquifer – Four scenarios that allow water-level declines of 5, 10, 15, and 20 feet after 50 years, respectively.

METHODS:

The requested analysis for the Edwards-Trinity (Plateau) Aquifer was based on maintaining a specified water-level decline from current average static water level elevation after 50 years.

The amount of data available for the Edwards-Trinity (Plateau) Aquifer is considerable; information on effective recharge and specific yield is available from the TWDB Groundwater Availability Model (GAM) (Anaya and Jones, 2004) for the aquifer. Water level data (2000-present) is also sufficient to determine

current average aquifer static water level elevation for estimating draft managed available groundwater (TDLR, 2009; TWDB, 2009).

Analytical estimates for the Edwards-Trinity (Plateau) Aquifer were requested due to possible simulation problems with the GAM in Pecos, Glasscock and Reagan counties (Donnelly, 2007; Tu, 2008).

A transient hydrologic budget for the saturated portion of an aquifer is described by Freeze and Cherry (1979, p.365):

$$Q(t) = R(t) - D(t) + \frac{dS}{dt}$$

where: $Q(t)$ = total rate of groundwater withdrawal

$R(t)$ = total rate of groundwater recharge to the basin

$D(t)$ = total rate of groundwater discharge from the basin

$\frac{dS}{dt}$ = rate of change of storage in the saturated zone of the basin

For this analysis, it is assumed that:

$$R(t) = R(r) + R(e)$$

where: $R(r)$ = rejected recharge for the basin

$R(e)$ = effective recharge

In addition, it is assumed that:

$$R(r) \approx D(t)$$

Therefore, the total rate of groundwater withdrawal equals effective recharge plus the change in storage of the aquifer, or:

$$Q(t) = R(e) + \frac{dS}{dt}$$

County, regional water planning area, river basin, subcrop/outcrop, and groundwater conservation district boundaries subdivide the aquifer into map areas (Figure 1). The areal extent of each aquifer map area was calculated. These areas were used to calculate estimated annual effective recharge.

These map areas were multiplied by the estimated aquifer specific yield, and then by uniform water level declines of 5, 10, 15, and 20 feet. These volumes were then divided by 50 years to obtain a yearly volume. In cases where unconfined and confined conditions existed, those were calculated separately.

Annual effective recharge to the aquifer was calculated by multiplying each area by the average precipitation (1971 to 2000) and an effective recharge rate developed for the Edwards-Trinity (Plateau) Aquifer GAM.

The calculations were completed in a Microsoft Excel worksheet.

PARAMETERS AND ASSUMPTIONS:

- The estimated current average static water level elevation of the Edwards-Trinity (Plateau) Aquifer within the analyzed area, ranges from 1,200 to 2,930 feet above mean sea level (TDLR, 2009; TWDB 2009).
- The areas for each subdivision were calculated from the Texas Water Development Board (TWDB) shapefile for the Edwards-Trinity (Plateau) Aquifer, projected into the GAM projection (Anaya, 2001).
- Areas, in acres, were calculated within ArcGIS 9.2.
- Average annual precipitation was used to calculate annual effective recharge volumes.
- The average annual precipitation for each aquifer map area (Table 1) was determined from the Texas Climatic Atlas (Narasimhan and others, 2008) which is for the average for years 1971 to 2000.
- The estimated annual effective recharge for the Edwards-Trinity (Plateau) Aquifer in the analyzed area of GMA 7 is 826,537 acre-feet per year (Table 1).
- Annual effective recharge from precipitation is 2 to 11 percent of annual precipitation (Anaya and Jones, 2004).
- The draft managed available groundwater volume estimates are the sum of the annual effective recharge amount and the volume of water depleted from the aquifer based on the draft desired future condition.
- Annual volumes are calculated by dividing the total volume by 50 years.
- The aquifer is treated as a one layer water-table system with values of specific yield that range from 0.2 to 0.0004 (Anaya and Jones, 2004).
- Conditions were assumed to be physically possible across the groundwater management area.

Table 1. Estimated annual effective recharge volume for the Edwards-Trinity (Plateau) Aquifer by map area subdivisions (See Figure 1).

									Total 826,537

GMA = groundwater management area

GCD = groundwater conservation district

UWCD = underground water conservation district

WCD = water conservation district

UWD = underground water district

C and R District = conservation and reclamation district

ac-ft/yr = acre-feet per year

UWC and Supply District = underground water conservation and supply district

** Recharge not calculated due to insignificant area.

The formula for this table is: areal extent (acres) * estimated average annual precipitation (feet) * effective recharge rate = estimated annual effective recharge (ac-ft/yr).

RESULTS:

The annual effective recharge estimate for the Edwards-Trinity (Plateau) Aquifer in Groundwater Management Area 7 is 826,537 acre-feet per year.

The results (Tables 2-6) show the draft managed available groundwater estimates for the Edwards-Trinity (Plateau) Aquifer in Groundwater Management Area 7. A 5-foot decline results in an estimated annual total volume of 832,808 acre-feet per year, a 10-foot decline results in an estimated annual total volume of 839,092 acre-feet per year, a 15-foot decline results in an estimated annual total volume of 845,365 acre-feet per year, and a 20-foot decline results in an estimated annual total volume of 851,646 acre-feet per year.

For estimates of draft managed available groundwater based on water level declines of 5, 10, 15, and 20 feet respectively and tabulated for individual groundwater management entities (GCD's, UWCD's, WCD's, UWD's, C and R Districts, and UWC and Supply Districts) see Tables 3-6.

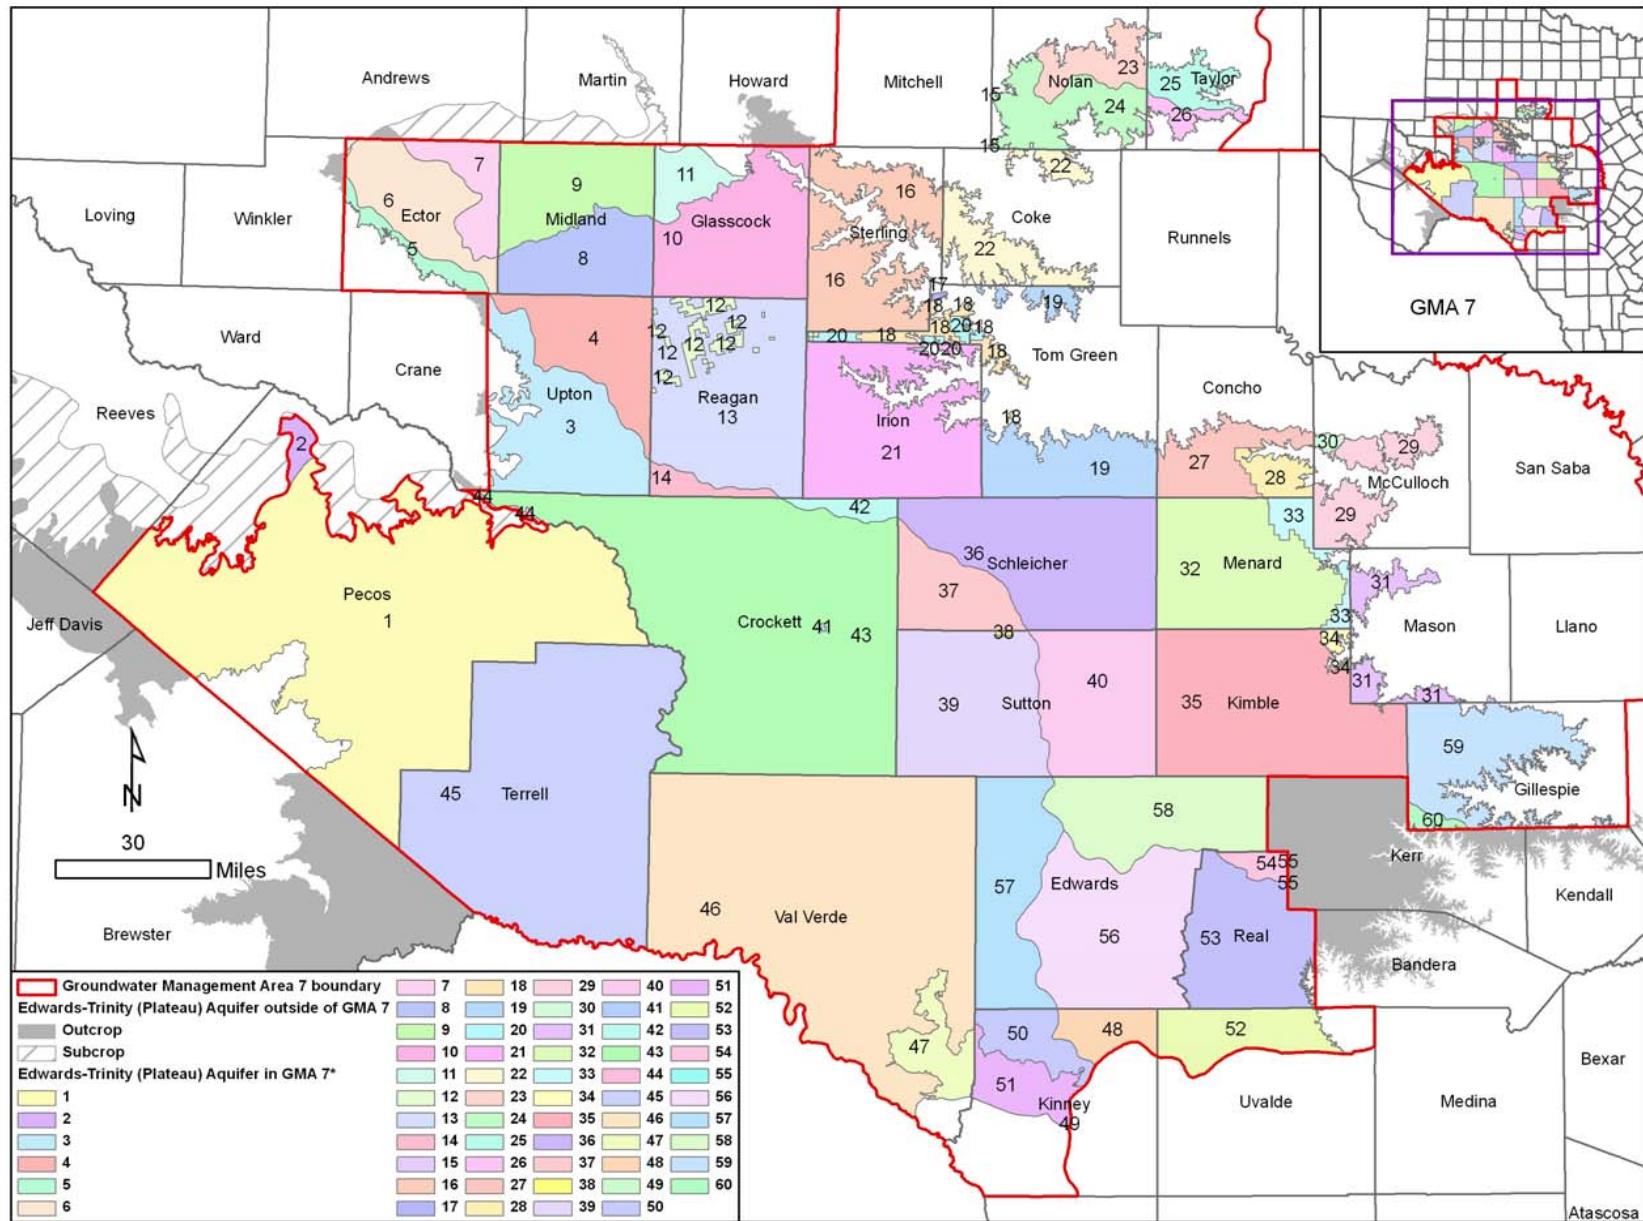

Figure 1. Geographic subdivisions for analyzing draft managed available groundwater for the Edwards-Trinity (Plateau) Aquifer in Groundwater Management Area 7. * See Tables 3-6 for a description of geographic subdivisions based on county, regional water planning area, river basin, groundwater conservation district, and subcrop/outcrop boundaries.

Table 2. Estimates of draft managed available groundwater for the Edwards-Trinity (Plateau) Aquifer summarized by map areas (see Figure 1).

GMA = groundwater management area

GCD = groundwater conservation district

UWCD = underground water conservation district

WCD = water conservation district

C and R District = conservation and reclamation district

UWD = underground water district

ac-ft/yr = acre-feet per year

UWC and Supply District = Underground water conservation and supply district

1 - feet above mean sea level

2 - This is the estimated total annual effective recharge volume for the Edwards-Trinity (Plateau) Aquifer by map areas as shown in Table 1.

** Recharge and availability not calculated due to insignificant area.

The formulas for this table are: specific yield * areal extent * desired total aquifer water level decline = estimated total volume from water level decline. Estimated total volume from water level decline/50 = estimated annual volume from water level decline. Then estimated annual volume from water level decline + estimated annual effective recharge = estimated annual total volume.

Table 3. Estimates of draft managed available groundwater for water level declines of 5 feet in the Edwards-Trinity (Plateau) Aquifer (see Figure 1).

RWPA = regional water planning area

GCD = groundwater conservation district

UWCD = under water conservation district

GMA = groundwater management area

WCD = water conservation district

C and R District = conservation and reclamation district

UWC and Supply District = underground water conservation and supply district

UWD = underground water district

GeoArea = Geographic areas defined by unique desired future conditions as specified by a groundwater management area.

MAG = Managed available groundwater in units of acre-feet per year.

* Availability not calculated due to insignificant area.

Limitations:

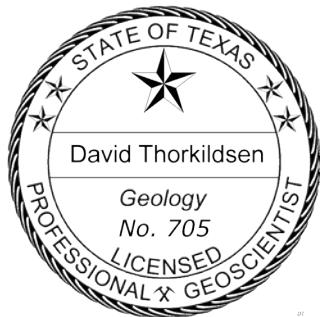

Additional data are needed to create improved estimates; these estimates are a fundamental interpretation of the requested conditions. This analysis assumes homogeneous and isotropic aquifers; however, conditions for the Edwards-Trinity (Plateau) Aquifer may not behave in a uniform manner. The analysis further assumes that precipitation is the only source of aquifer recharge, that lateral inflow to the aquifer is equal to lateral outflow from the aquifer, and that future pumping will not alter this balance.

Note that estimates of managed available groundwater are based on the best available scientific tools that can be used to develop managed available groundwater and that these estimates can be a function of assumptions made on the magnitude and distribution of pumping in the aquifer. Therefore, it is important for groundwater conservation districts to monitor whether or not they are achieving their desired future conditions and to work with the TWDB to refine managed available groundwater given the reality of how the aquifer responds to the actual magnitude and distribution of pumping now and in the future.
