1.0 EXECUTIVE SUMMARY

This Master Drainage Plan (MDP) was prepared to provide the City of Edinburg a planning tool to guide and prioritize future capital expenditures for the City's drainage systems within its boundaries and ETJ. The City currently operates and maintains a network of drainage ditches and storm sewer systems. Many of its outfall and storm systems are in need of improvements to alleviate flooding that have historically occurred throughout the City and to meet drainage needs of future development. This MDP was focused on the City's outfall drainage ditch systems.

The City of Edinburg's outfall systems are served by two major receiving drainage systems: North Main Drain and South Main Drain. These drainage ditches are part of the Hidalgo County Drainage District No.1 (HCDD1) Master Drainage System. The North Main Drain and South Main Drain outfall into the Main Floodwater Channel east of the City.

The Master Drainage Plan was developed to define various projects consisting of channel improvements, hydraulic structure replacements, and detention. The MDP was developed to establish conceptual designs only, and does not include sufficient details for final design or construction. A detailed hydraulic analysis should be performed to verify conditions for the implementation of the proposed improvements prior to final design. In addition, with the adoption of a "no-adverse impact" policy by the City, further analysis of the proposed improvements will be required to ensure that any impacts incurred due to the proposed projects are mitigated.

The existing drainage systems were evaluated to identify system inadequacies and determine drainage improvements required to alleviate existing flooding problems and upgrade the existing systems to provide drainage infrastructure needs for future development. Alternative solutions to reduce or eliminate flooding from flood prone areas were formulated and evaluated based on detailed hydrologic and hydraulic modeling analysis with consideration of potential hydraulic impacts of each alternative improvement.

ESRI ArcGIS 10.2 was used to facilitate various engineering efforts throughout the project development. Specific GIS applications included digital elevation model (DEM) from the LiDAR dataset obtained from TNRIS, base mapping, drainage basin delineations, watershed parameters extraction, channel cross-section geometric data extraction, drainage systems inventory and mapping. As part of the MDP, a set of GIS layers was developed to represent a digital version of the existing drainage systems and the MDP proposed improvements. This GIS set was included to provide the City a tool to manage the drainage systems and plan implementation in an efficient and systematic manner.

ArcHydro and GeoHMS were used to delineate overall drainage patterns and to assist the development of HEC-HMS models. HEC-HMS hydrologic modeling program was used to compute

CITY OF EDINBURG
MASTER DRAINAGE PLAN

peak flows and hydrographs at various locations within the drainage systems for the drainage ditches' hydraulic modeling analyses. GeoRAS was used to construct the HEC-RAS models, which were used to analyze water surface profiles and hydraulic capacity for the existing and proposed drainage ditches.

2.0 INTRODUCTION

2.1 Background

The City of Edinburg is part of the McAllen-Edinburg-Mission and Reynosa-McAllen metropolitan areas and located in the heart of the Lower Rio Grande River Valley of South Texas. The City of Edinburg has experienced significant population increase in recent years. According to the 2012 Census estimate, it has a total population of approximately 81,000. It is projected that the city's population will be more than doubled by 2060. The fast population growth has contributed to the frequency, severity and extent of drainage and flooding problems in many areas of the city in recent years. As land use changes with development, more impervious cover increases the amount of runoff and peak discharges. Future growth and development of the City will be greatly influenced by how well the existing and future drainage systems are maintained and managed. Many of the existing drainage systems do not adequately convey runoff from frequent rainfall events and are in need of improvement.

The City has recognized the needs of improving the drainage systems and authorized this master drainage plan study. The purpose of the plan was to identify the location and extent of existing drainage inadequacies, determine future drainage needs, and propose drainage system improvements. In November, 2013, the City entered an agreement with TEDSI Infrastructure Group Inc. to provide professional engineering services to develop a Master Drainage Plan for the City. The MDP was made possible through the Texas Water Development Board Flood Protection Plan Grant (1348321592) along with the City's matching funding as a participant of the National Flood Insurance Program.

2.2 Study Purpose and Needs

The City recognizes the need for a master drainage plan to provide drainage solutions necessary to reduce flood risk to existing flood-prone areas and adequately accommodate future urbanization. The need for a Master Drainage Plan study is evident by frequent flooding with varying degrees throughout the City's history. Drainage and flood protection has long been a challenge for the City of Edinburg and other communities within the watershed due to the flat topography, periodic intense rainfalls, and limited capacities of existing drainage systems. The rapid population and economic growth in recent years has intensified the frequency, severity and extent of drainage and flooding problems within the City.

The overall purpose of this project was to develop a Master Drainage Plan that provides an effective, implementable plan to eliminate or significantly reduce the flood risks and provide proposed improvements to accommodate the rapid urban growth within the study area. Specific objectives of this project include:

- Identify locations and extent of existing flooding problem areas.

- Formulate, evaluate, and optimize drainage improvements (plans) to eliminate or reduce existing flooding problems.
- Identify, formulate and evaluate drainage improvements to provide drainage infrastructure for future needs.
- Develop a Geographic Information System (GIS) database for the city's drainage systems associated with the MDP.

2.3 Project Considerations

Several factors were considered in evaluating the existing drainage outfall ditch systems, identifying flooding problem areas, inadequate drainage systems, and determining and optimizing drainage improvements. These considerations were:

- Historical documented flooding areas were obtained from the City and public residents.
- Public infrastructure areas that are considered high flood risk were identified by the City and Edinburg ISD.
- HCDD1 drainage improvement planning projects as related to North Main Drain and South Main Drain such as: FEMA floodplain map modernization project, Raymondville Drain Project, Delta Region Water Management Project, and Monte Cristo Drain improvement project.

2.4 Project Study Area

The project study area covers the City of Edinburg corporate limits (City limits) and extraterritorial jurisdiction (ETJ), as shown in **Figure 2-1**. The City of Edinburg covers a total area of 36.67 square miles and is located within the Hidalgo County Main Floodwater Channel Watershed. The topography of the study area is typical of areas located in the Gulf Coastal Plan. It is generally flat, sloping gently toward the coast at an average grade of about 1 foot per mile. The flat topography imposes problems on the design of practical drainage systems because the hydraulic grades for drainage ditches are limited. Further, the City is located within the natural overland flow path within the Main Floodwater Channel Watershed and lies within a natural depressed low lying area, which complicates the City's efforts to develop an effective gravity drainage system.

The overall watershed slopes from west to east, across the City of Edinburg. From the west boundary of the ETJ to the City's urbanized areas, the overland slope is approximately 8 feet per mile. Within the City's urbanized center, which is located mainly between the North Main Drain and US 281 (IH-69), the overland slope is approximately 1.5 feet per mile; an elevation range from 96 feet to 92 feet within a 2.5 mile reach. The significant change in the overland slope across the watershed makes the City vulnerable to excessive ponding and flooding during storm events. The flatter slope within the City's urbanized areas reduces the relief need to efficiently

convey the runoff away. The overland natural topography for the City area is shown in **Figure 2-2.**

The urbanized portion of the City is primarily served by underground storm sewer systems. Open drainage ditches serve as the outfall channels for the City and its storm sewer systems. These ditches outfall either directly into, or into a lateral of, the North Main Drain or South Main Drain, which are part of the HCDD1 Master Drainage System.

The study area has a subtropical and semi-arid climate with dry winters and hot, humid summers. The average annual rainfall is approximately 26 inches. Most precipitation occurs in summer thundershowers and intense rainfall associated with tropical depressions and hurricanes that characterize the Gulf Coast from June to October.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

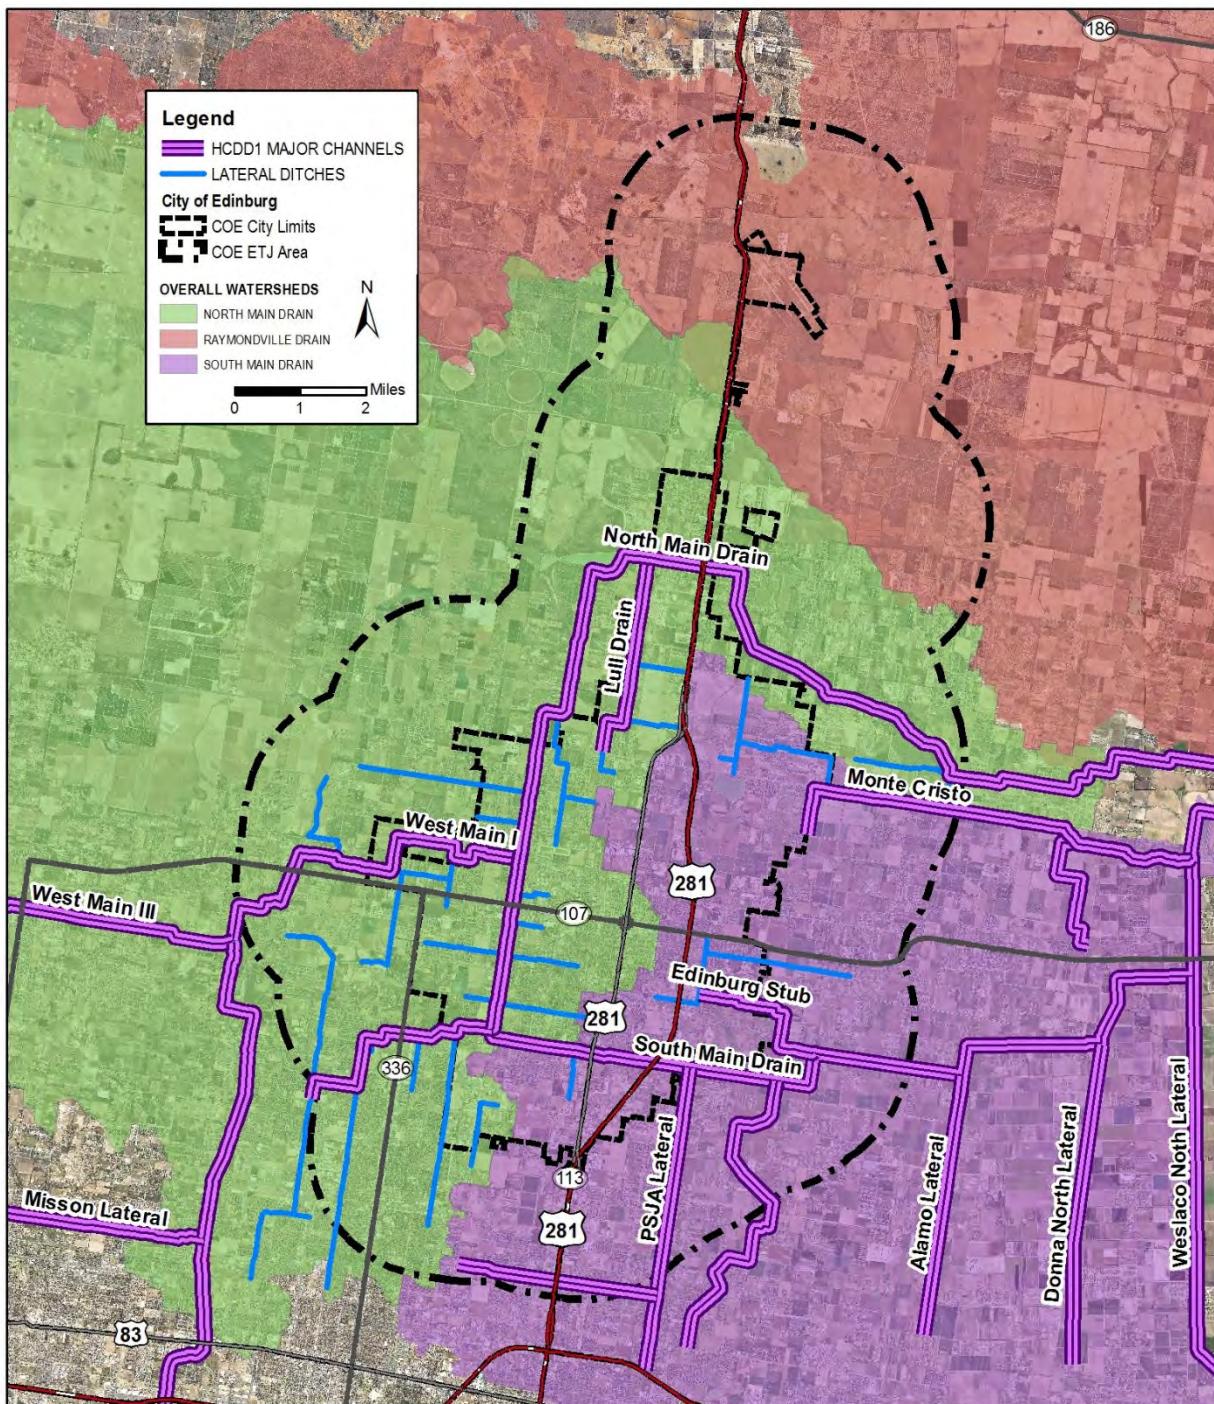

Figure 2-1. Project Study Area

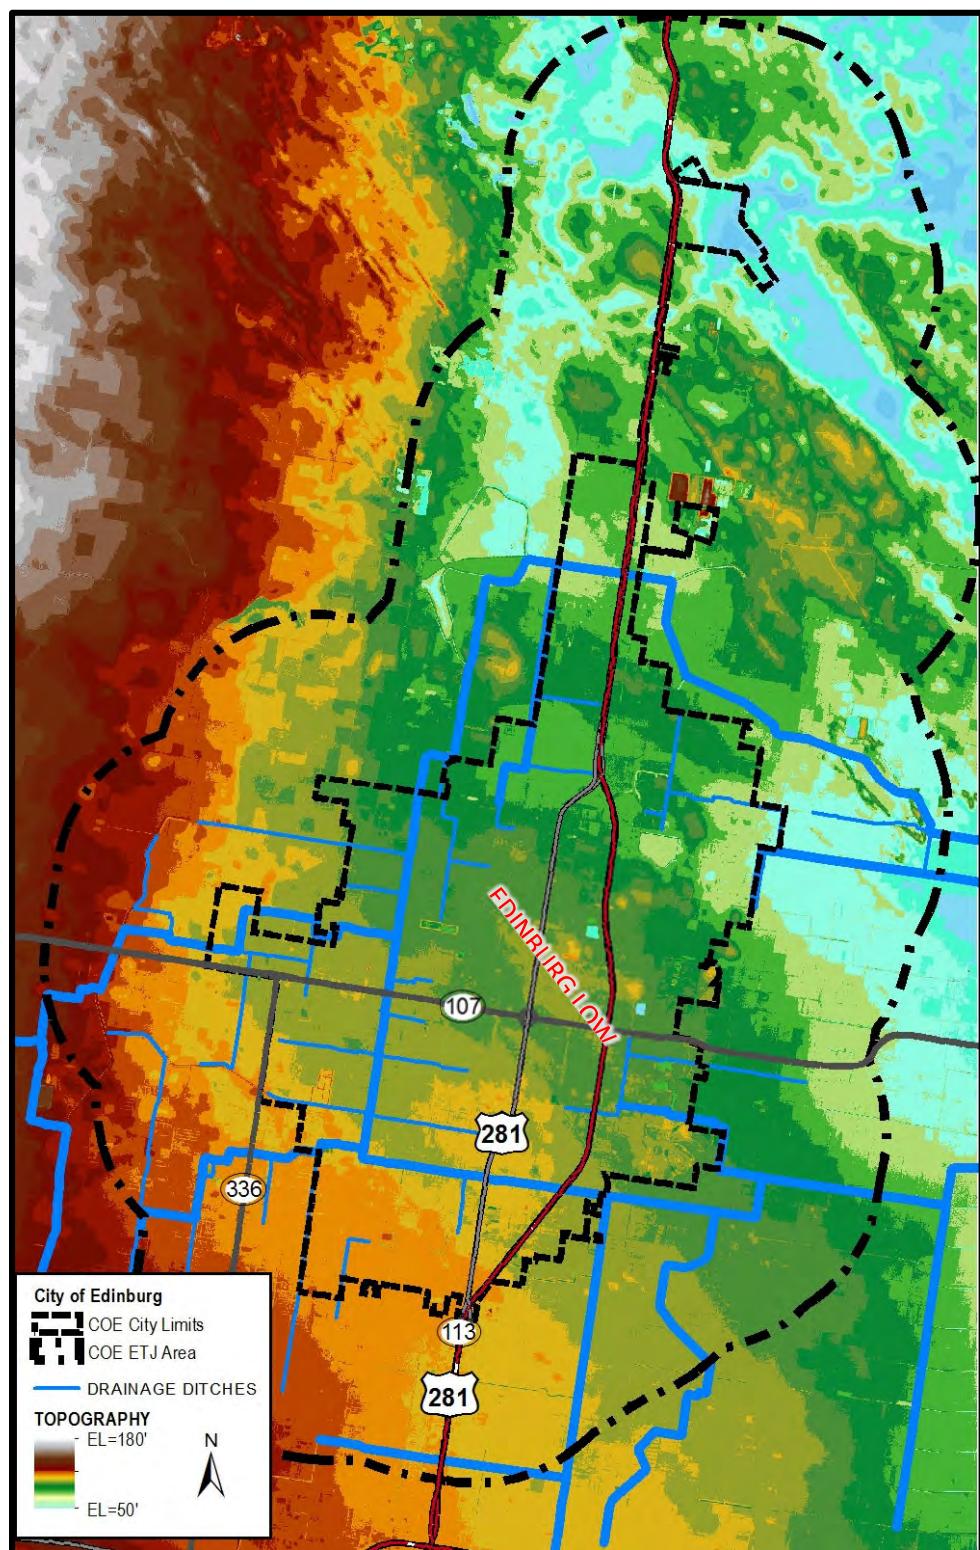

Figure 2-2. Project Area Overland Topography

2.5 NFIP Participation

The City of Edinburg has been a participating partner in the National Flood Insurance Program (NFIP) since January 1, 1978. As reported by FEMA, the City of Edinburg has a total of 2,379 flood insurance policies in-force representing a total property value of approximately \$456M. During the City NFIP participation period, the total flood insurance claims include 601 losses for a total payment of approximately \$6.2M.

Based on the “Cover the Border Hazard Mitigation Planning Project” by the Texas A&M International University, Rio Grande Institute, and H2O Partners, the estimated value of residential, commercial and industrial structures located in the 100-year floodplain is approximately \$525M, which represents the improvement (structure) value for approximately 3,933 structures.

The flood hazard areas, as delineated on the FEMA Flood Insurance Rate Maps (FIRM) effective date June 6, 2000 for Hidalgo County (Community No. 480334) and the City of Edinburg (Community No. 480338), are shown in **Figure 2-3**. As shown in the floodplain figure, there is widespread flooding along the North Main Drain.

Also shown delineated within a flood hazard area is the low, depressed area within the City centralized area; this area is referenced as the “Edinburg Low” within the FEMA Flood Insurance Study (FIS). Based on the LiDAR topography, see **Figure 2-2**, the Edinburg Low is a natural low area that functions as an overflow path between the east and west sides of the City of Edinburg. The Edinburg Low runs in a northwest to southeast direction through the City center located at the Hidalgo County Courthouse. The elevation break point along the flow path is located at the Courthouse, at University Dr. (SH 107) and Closner Blvd. (BS 281).

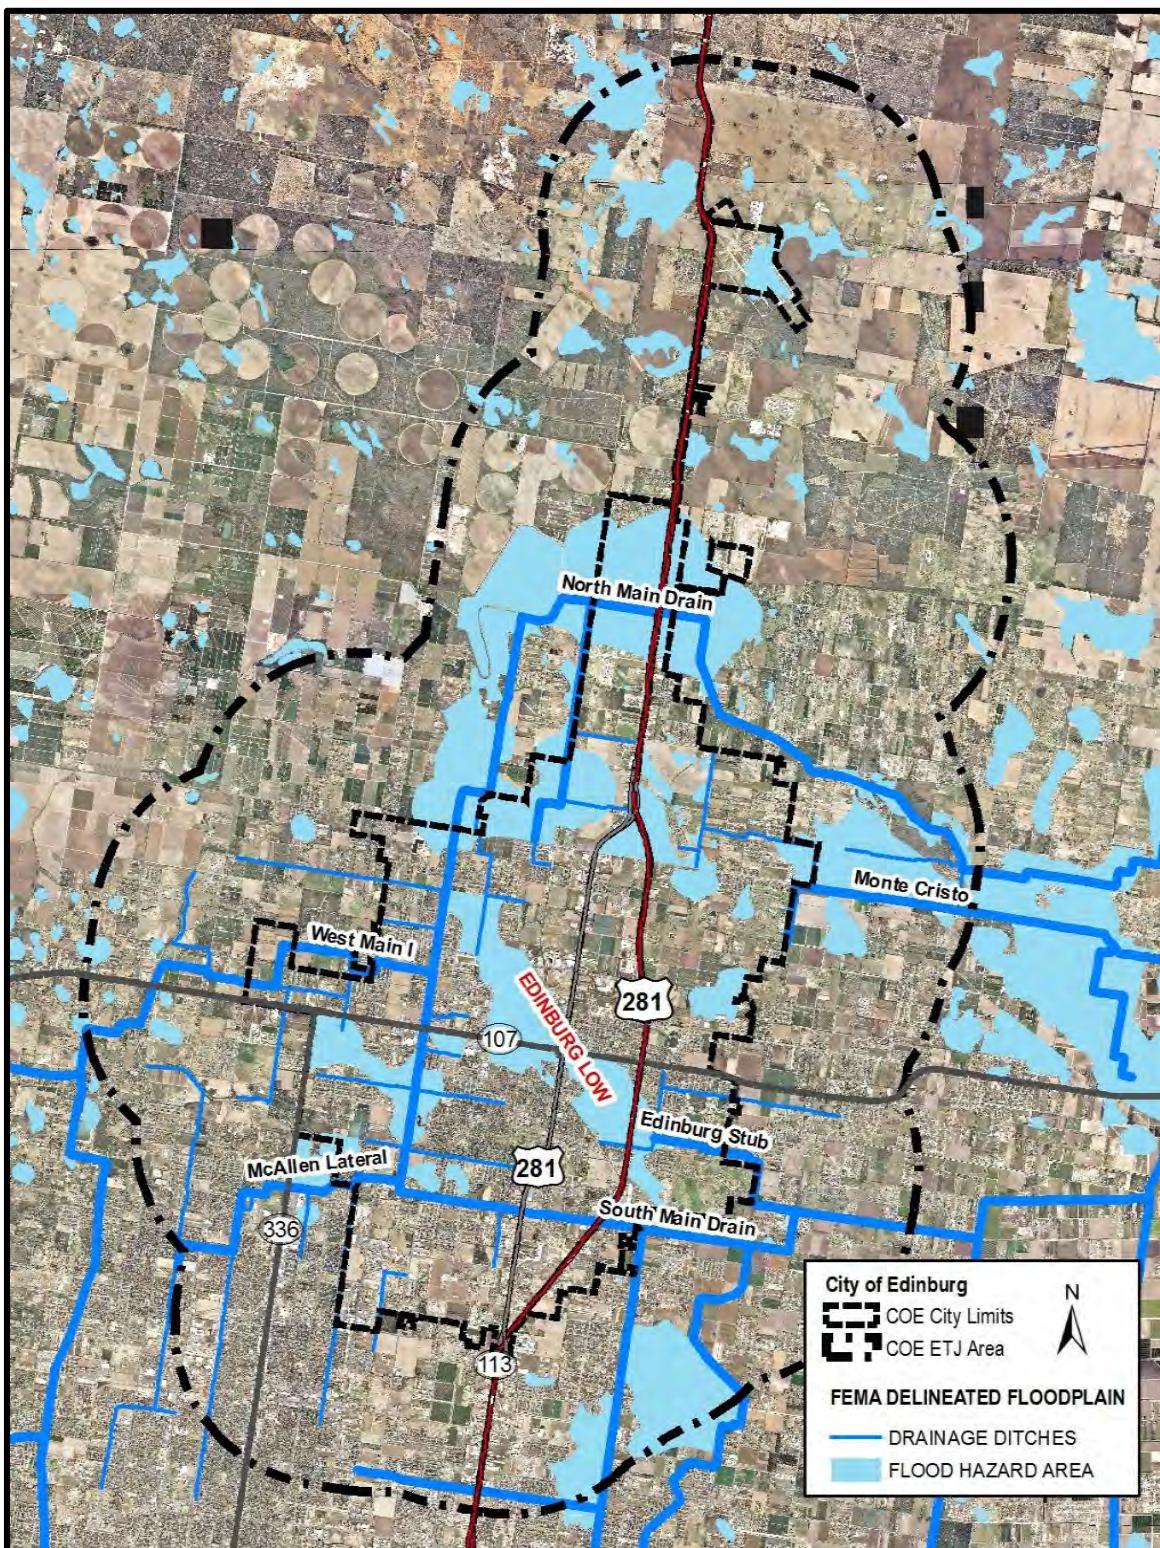

Figure 2-3. FEMA Delineated Flood Hazard Areas

2.6 Historical Flooding

The City of Edinburg has experienced frequent flooding of varying degrees throughout its history. Adequate drainage of storm water runoff has long been a challenge for the City due to the flat topography, periodic intense rainfalls, and limited capacities of existing drainage systems. Localized flooding threatens residences and business, damages structures, and hinders traffic mobility. The City of Edinburg and the Edinburg Independent School District have identified public facilities that are at risk of potential flooding. These flood concerns locations as well as documented locations of flooding from recent storm events are shown in **Figure 2-4**.

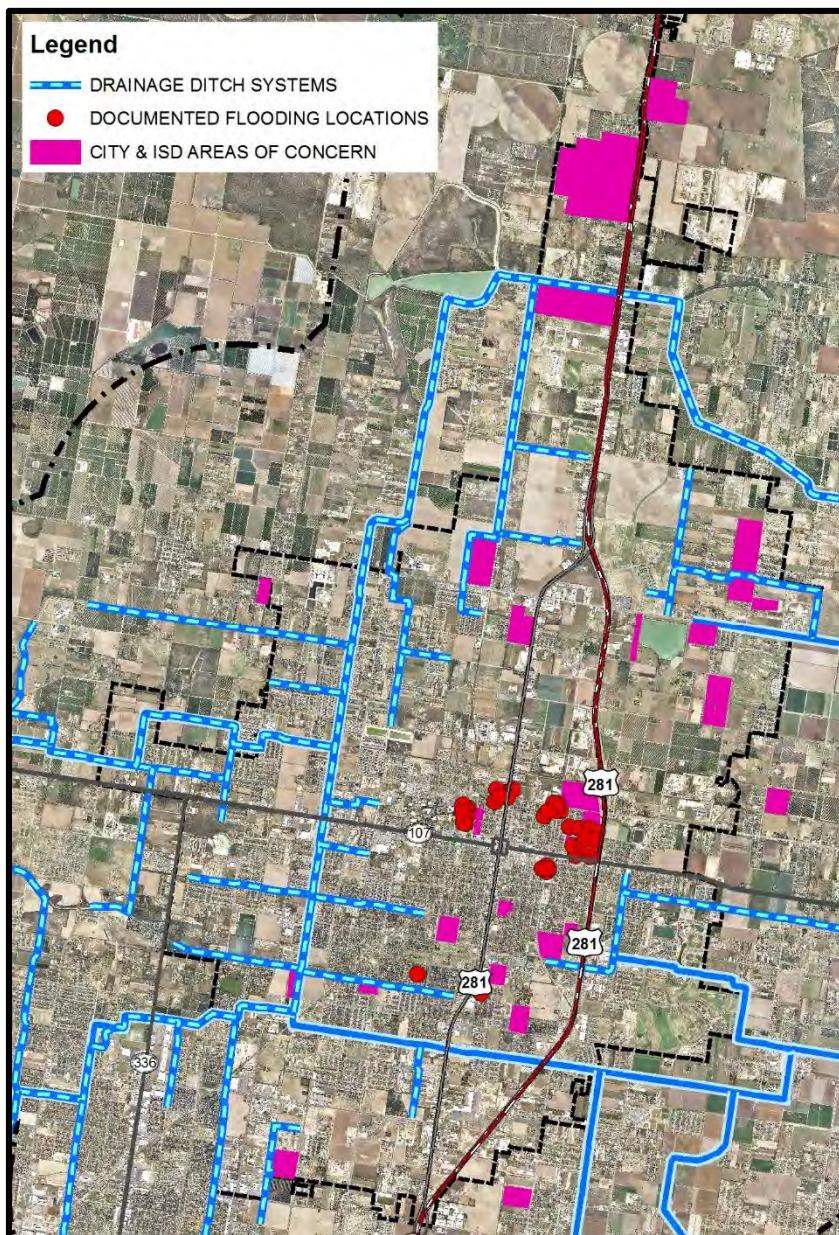

Figure 2-4. Areas of Flood Concern and Documented Flooding Locations

Figure 2-5 shows example pictures of localized flooding with the City which occurred during April 2012 and September 2014 storm events. These storm events are typical of high intensity, short duration rainfall which occurs frequently within the Lower Rio Grande Valley region.

Figure 2-5. Localized Flooding Examples During April 2012 and September 2014 Storm Events

The Lower Rio Grande Valley region is also prone to tropical storms and hurricanes, which produce substantial rainfall and result in wide-spread flooding and significant damage to the region. In July 2008, Hurricane Dolly rainfall amounts within Hidalgo County ranged from 6 to 14 inches; **Figure 2-6** shows the rainfall spatial distribution for the storm event.

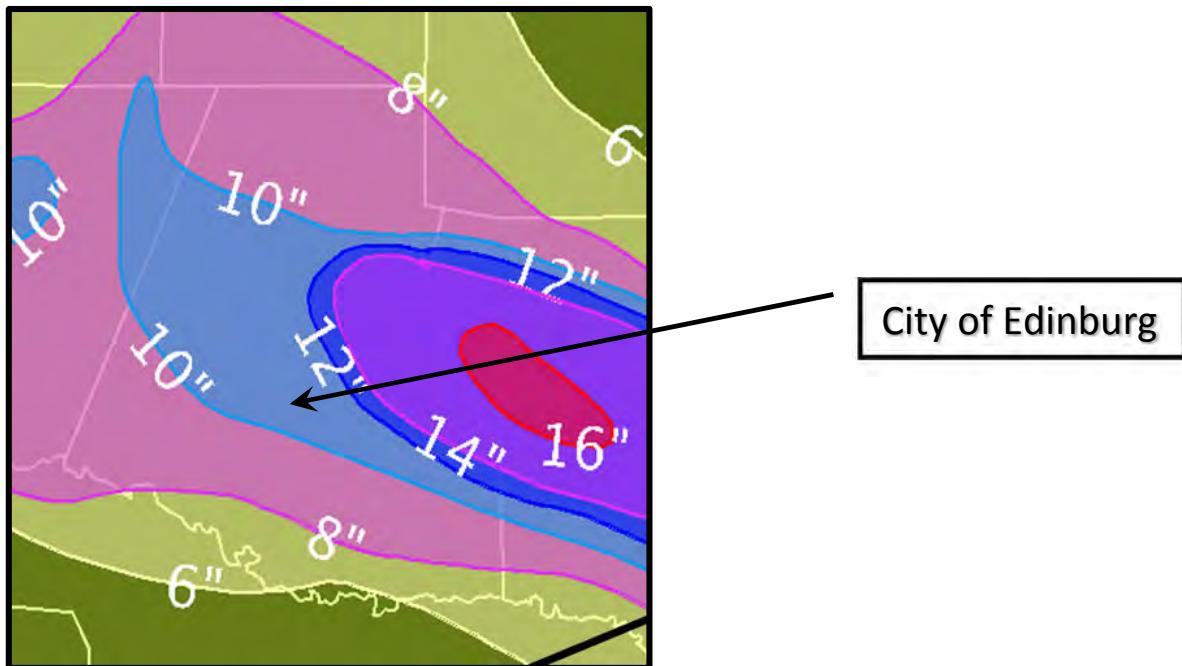

Figure 2-6. Hurricane Dolly Rainfall Spatial Distribution

In July 2010, Hurricane Alex rainfall amounts within Hidalgo County ranged from 5 to 8 inches; Figure 2-7 shows the rainfall spatial distribution for the storm event.

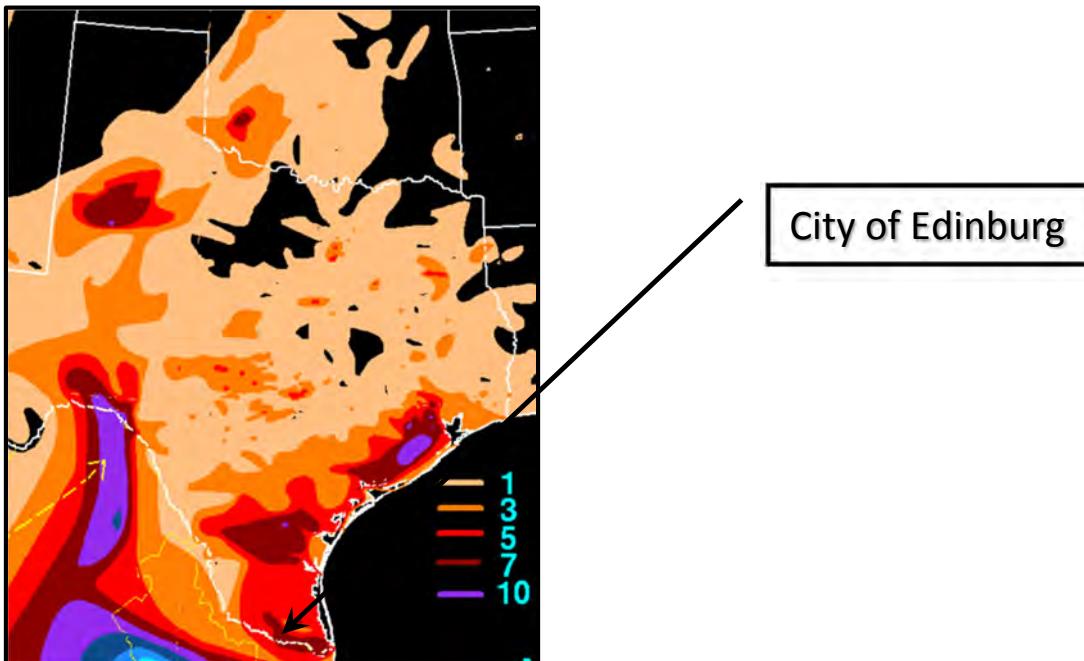

Figure 2-7. Hurricane Alex Rainfall Spatial Distribution

2.7 Environmental Constraints

As part of this contract, a Phase I Environmental Site Assessment (ESA-I) and Constraints Map report was generated for the project area. The environmental documentation was prepared by Raba Kistner Environmental, Inc. and presented within a report entitled "Phase I Environmental Site Assessment (ESA-I) and Constraints Map for City of Edinburg Master Drainage Plan – 16 Outfall Locations, Edinburg, Hidalgo County, Texas" dated January 2014. The referenced ESA-I and Constraints Map are provided within **Appendix G** of this drainage report.

The report summarized conclusions included:

Based on the information reviewed, there was no evidence that the subject or adjacent properties are currently under federal or state environmental enforcement action. The SITE reconnaissance, regulatory database review, and historical review, revealed no evidence to suggest that there are any potential environmental concerns associated with the SITE Northeast, Southeast, Northwest and Southwest outfall locations that would preclude construction or development activities from an environmental standpoint.

This assessment has revealed no evidence of recognized environmental conditions in connection with the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

This assessment has revealed no evidence of recognized environmental conditions in connection with the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

3.0 GIS APPLICATION

Geographic Information Systems (GIS) provides a powerful workspace for storing, compiling, overlaying, integrating, updating and exchanging, analyzing, displaying, and managing geospatial data. It provides a consistent method for watershed and stream network delineations using digital elevation models (DEMs) of land-surface terrain. GIS provided a vital role, from GIS data manipulation to geospatial data layers creation, in developing this project. This section discusses the applications of ArcGIS tools in the project development and the GIS layers developed for the Master Drainage Plan.

ESRI ArcGIS 10.2 was used to facilitate the various engineering workflows required for the project development, including base mapping, topographic data development, drainage system delineations, drainage and hydrologic parameter extraction, hydrologic and hydraulic model development and analyses, and drainage system inventory. The suite of ArcGIS tools utilized for the purpose of this project include Spatial Analyst, 3D Analyst, ArcHydro, HEC-GeoHMS, HEC-GeoRAS, and other ArcGIS extensions.

Digital base maps were compiled from various sources, such as: City of Edinburg, Hidalgo County, Texas Natural Resource Information Systems (TNRIS), TWDB, FEMA, NOAA, and USGS. The available datasets were compiled using conversion, spatial referencing, and integration operations. GIS base map data layers for this project included raster aerial photographs, vector street maps, political boundaries (cities, counties, districts), floodplain delineations, and stream and drainage ditch centerlines.

3.1 Datum and Coordinate System

The common datum, projection, and coordinate system for this project are:

- Horizontal Datum - North American Datum 1983 (NAD83) (Feet)
- Vertical Datum - North American Vertical Datum 1988 (NAVD88)
- Projection - Lambert Conformal Conic
- Coordinate System - State Plane Texas South 4205

3.2 GIS Feature Layers

As part of the engineering efforts in developing the master drainage plan, a set of GIS data layers were created, which provide a digital version of the master drainage plan. The GIS data layers can be updated by incorporating future drainage projects and provide an easy way to locate drainage features such as:

- Watershed Basin
- Drainage Ditch Subbasin
- Drainage Ditch Centerline

- Cross-Culvert Structure Inventory Locations
- Drainage Ditch Improvement Reaches
- Proposed Cross-Culvert Improvement Locations
- Flooding Concerns and Documented Flooding Locations
- Floodplain Boundary
- Street Map
- Soil Map
- Land Use Map
- City Boundary
- County Boundary
- LiDAR Topography DEM
- Digital Aerial Photos

3.3 LiDAR DEM

Automated extraction of topographic parameters from DEMs has been recognized as a viable alternative to traditional surveys and manual evaluation of topographic maps, particularly as the quality and coverage of DEM data increase. A continuous DEM dataset was developed based on tiled LiDAR datasets obtained from Texas Natural Resource Information System (TNRIS), which was flown in 2011. The original LiDAR has a resolution of 3.3 feet in LAS format. These tiled LiDAR datasets were converted to ESRI Arc GRID format through a series of spatial data processing procedures including LAS to Multipoint, Multipoint to TIN, and TIN to GRID. The resulting tiled grid datasets were then merged into one single grid dataset. With consideration of the very large size of LiDAR dataset, a 5-foot grid dataset was created as the base DEM dataset for this project.

By examining the high resolution LiDAR DEM imagery, natural streams and drainage ditches are generally well defined by the LIDAR data. However at many stream crossings (culverts and bridges), elevations on top of the structures were included in the DEM. If the original DEM data was used for automated drainage delineations, the natural drainage patterns could be erroneously modeled without removing these structures from the DEM.

To remove the dam-like hydraulic structures in the DEM, stream and drainage ditch lines and aerial photographs were used to identify stream crossing structure locations. Stream crossing breaklines were created at each hydraulic structure where the top elevation of the structure was included in the DEM. ArcHydro reconditioning tool was used to burn the resulting stream crossing breaklines into the DEM with a certain depth based on the adjacent flowline elevations at the structure. A hydro-enforced DEM was created. This reconditioned 5-foot DEM was used as the base grid dataset for this study.

In developing the HEC-HMS and HEC-RAS models, the ArcHydro, HEC-GeoHMS, HEC-GeoRAS tools were extensively used to facilitate the delineation of drainage areas, extraction of drainage parameters, and extraction of channel cross section geometric data.

3.4 Aerial Photographs

Aerial photographs for the study area were obtained from Texas Natural Resources Information Services (TNRIS) and Hidalgo County, TX. The aerial photographs are dated 2013 and are produced with 0.5 and 1.0 foot resolution.

4.0 HEC-HMS MODELING ANALYSIS

Watershed runoff discharge is a function of precipitation, rainfall losses, and runoff processes. The U.S. Army Corps of Engineers (USACE) HEC-HMS (v. 4.0) computer program was used to evaluate and compute runoff peak flows and hydrographs at various locations within the studied watersheds for this study. Various frequency storm events were evaluated, including 10-, 25- and 100-year, and analyzed for both existing and ultimate conditions. The resulting peak flows and hydrographs were used as input data to HEC-RAS modeling analysis to identify flooding problem areas and evaluate alternative drainage improvement plans.

4.1 Overall Watersheds

The City drainage ditches outfall into the HCDD1 Master Drainage System, specifically the Main Floodway Channel network system. The primary HCDD1 watersheds serving the City include North Main Drain and South Main Drain. Additionally, Raymondville Drain serves a small portion of the City (specifically the South Texas International Airport at the City of Edinburg) and the northern portions of the City ETJ; however the City does not currently have any major outfall ditches within this watershed. The overall HCDD1 Master Drainage System Watershed map is shown in **Figure 4-1**.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

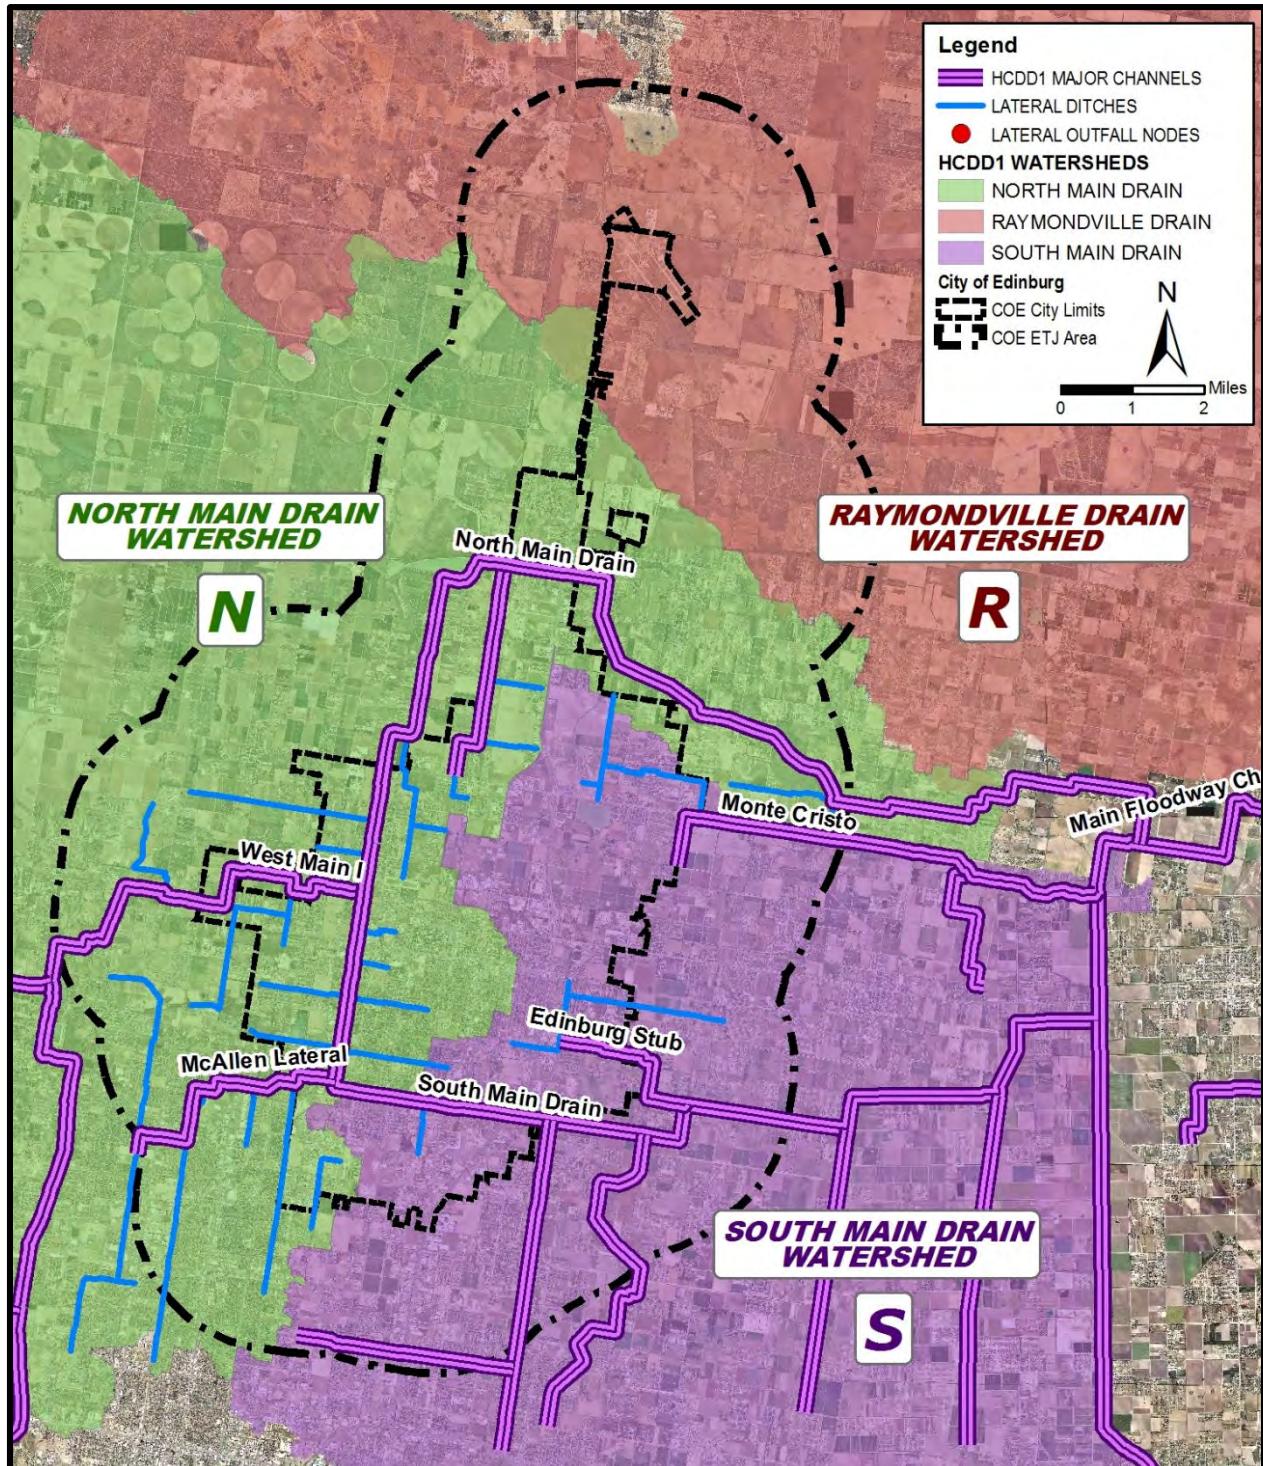

Figure 4-1. Overall Drainage Delineations

4.2 Drainage Area Delineation

Drainage areas were delineated for each drainage system analyzed based on the high resolution LiDAR topographic data and field survey data for this project using ArcGIS tools. The resulting drainage area delineations were verified by aerial photography and field visits. As discussed in Section 3.3, a continuous hydrologic-correct LiDAR DEM dataset was developed based on tiled LiDAR datasets obtained from TNRIS. The LiDAR DEM data provided a more accurate terrain representation than the traditional USGS DEM.

ArcGIS tools including Spatial Analyst, 3D Analyst, ArcHydro and HEC-GeoHMS were used to process the LiDAR DEM datasets for automated drainage and stream delineations and generation of spatially based hydrologic input files for HEC-HMS model development. Automated drainage delineation included a series of spatial data processing steps to derive the drainage networks from the DEM dataset, including flow direction, flow accumulation, stream definition, watershed delineation, watershed polygon processing, stream processing, and watershed aggregation. Watershed physical characteristics that were extracted included drainage areas, longest flow lengths, and slopes. These watershed parameters were then used to assist estimation of other watershed and hydrologic parameters such as CN, Percent Impervious Area, and time of concentration (Tc).

Drainage systems and subbasins were delineated as shown in **Figure 4-2**. There were total 17 drainage system subwatersheds delineated for the study area. Thirteen (13) drainage systems are located within the North Main Drain Watershed; four (4) drainage systems are located within the South Main Drain Watershed.

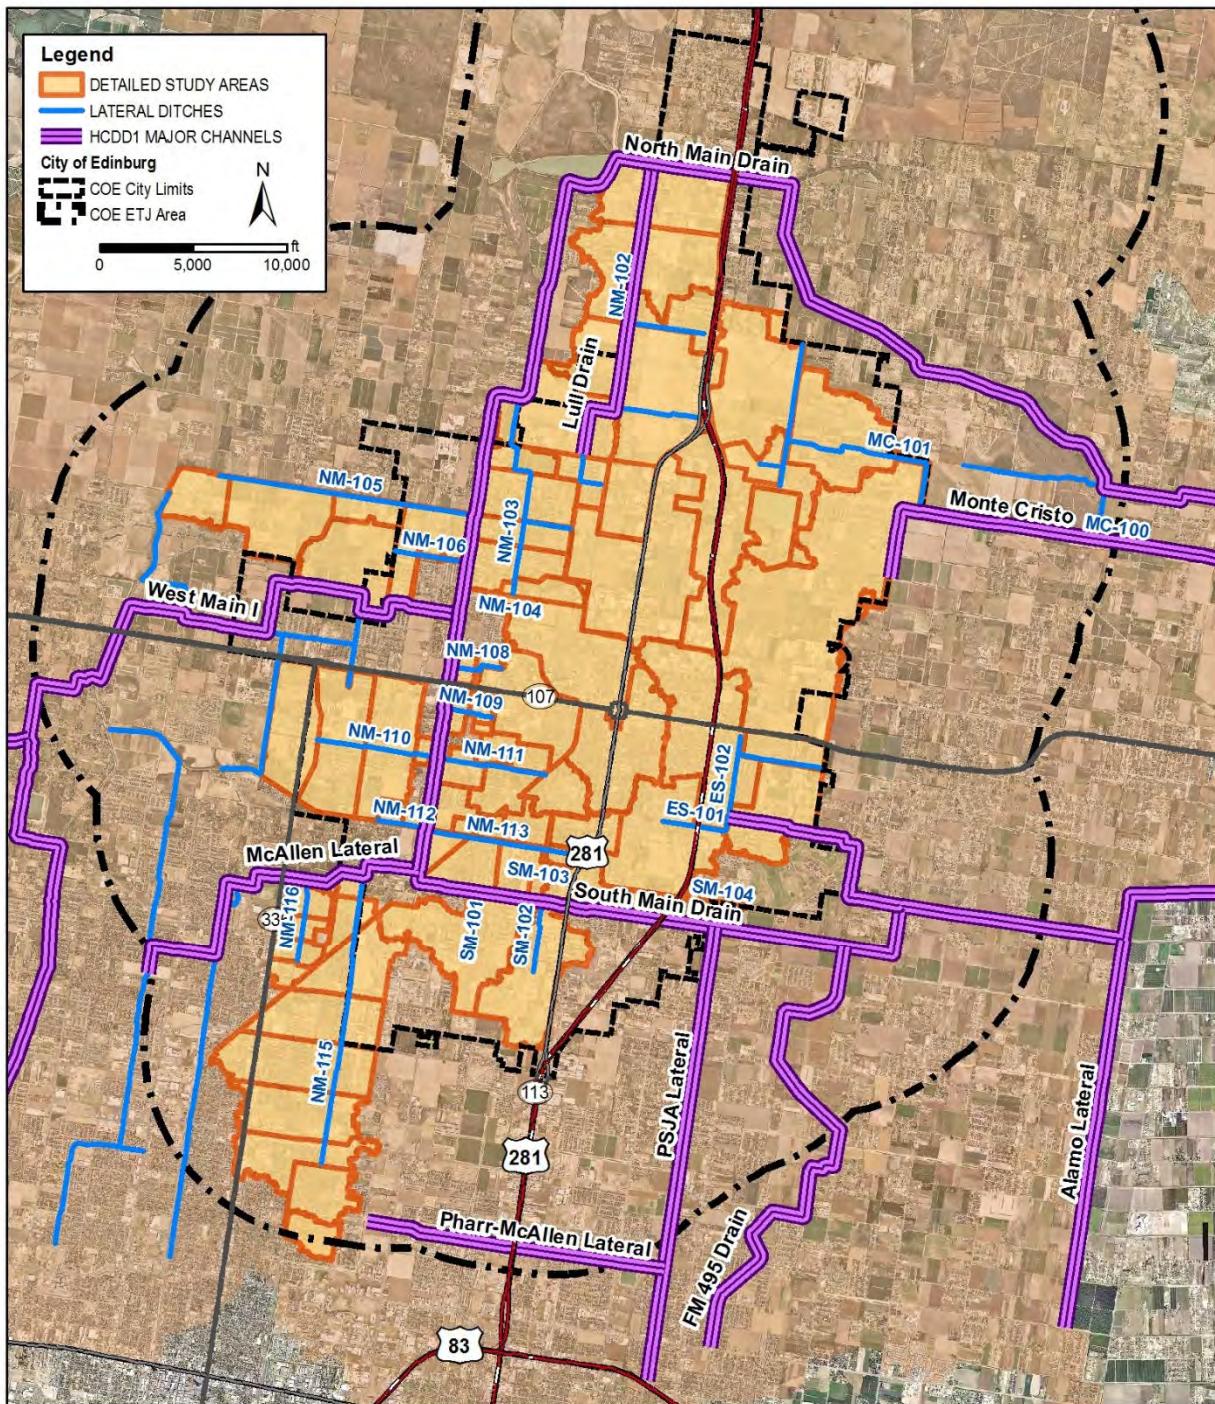

Figure 4-2. Drainage Systems Delineations

4.3 Precipitation Data

The frequency-based hypothetical storm method was selected within the HEC-HMS meteorologic model. This method defines a storm event that the precipitation depths have a consistent exceedance probability for various storm durations. This model employs a balanced and nested rainfall distribution, which positions the block of maximum incremental depth at the middle of the required duration. The remaining blocks are arranged then in descending order, alternately before and after the central block.

Using this method requires input of depths of precipitation for various durations and frequencies. The precipitation depths for various durations for a specified exceedance probability are usually obtained by consulting locally-developed depth-duration-frequency functions. For this project, the precipitation depths were taken from the USGS publication – *Atlas of Depth-Duration Frequency of Precipitation Annual Maxima for Texas, 2004* by Asquith and Roussel. The newly developed Atlas was developed based on the generalized logistic distribution method (GLO) which is discussed in detailed in the Water-Resources Investigation Report by USGS in cooperation with Texas Department of Transportation. The USGS precipitation depth data are more accurate than those based on the traditional TP-40 and HYDRO-35. **Table 4-1** below summarizes the precipitation depths for various durations and storm events.

TABLE 4-1. RAINFALL DEPTHS-DURATION-FREQUENCY

STORMS	15-MIN	1-HR	2-HR	3-HR	6-HR	12-HR	24-HR
2-year	1.00	1.80	2.20	2.30	2.60	2.85	3.20
5-year	1.30	2.40	2.90	3.15	3.50	4.00	4.50
10-year	1.52	2.85	3.50	3.75	4.25	4.80	5.45
25-year	1.80	3.40	4.30	4.60	5.45	6.00	6.90
50-year	2.00	3.90	5.00	5.40	6.40	7.00	8.00
100-year	2.20	4.45	5.70	6.40	7.40	8.25	9.50

4.4 Initial Abstraction and Infiltration Losses

Significant rainfall losses in flood event analysis include both surface storage and infiltration. The NRCS Runoff Curve Number (CN) Loss Method was used for this study as traditionally used for the study area. This method relates accumulated rainfall excess or runoff to accumulated rainfall with an empirical curve number (CN) in the following equations:

$$Q = \frac{(P - I_a)^2}{P - I_a + S}$$

$$S = \frac{1000}{CN} - 10$$

Where Q = runoff (inches), P = rainfall (inches), I_a = initial abstraction, S = potential maximum retention after runoff begins (inches), and CN = curve number.

Curve number (CN) takes into account several factors such as soil type, cover, management practices, and hydrologic condition. The variation in infiltration rates of different soils is incorporated in the curve number selection through the classification of soils into four hydrologic soil groups as A, B, C, and D, with A having the highest and D the lowest infiltration capacities.

CN is also related to three antecedent runoff conditions: AMC III for relatively high runoff potential, AMC I for relatively low runoff potential, and AMC II for average runoff potential. Based on information provided within “Runoff curve number based on soil-cover complex and climatic factors” dated 1983 by Hailey, James L and McGill, H.N., as well information referenced within the TxDOT Hydraulic Manual 2014, AMC I condition is considered as a represent average condition for City of Edinburg study area and therefore used to estimate CN values for this study.

For this master drainage planning study, the landuse and impervious cover were considered separately from the CN value determination in order evaluate the ultimate conditions of the drainage areas. The impervious cover values were entered as separate parameters within the HEC-HMS model. The curve number was evaluated to represent an undeveloped, agriculture use with brush cover under fair hydrologic conditions. **Table 4-2** below lists the CN values from TR-55 and used for this study.

TABLE 4-2. NRCS CURVE NUMBERS

SOIL GROUP	AMC I	AMC II	AMC III
A	19	35	55
B	36	56	75
C	51	70	84
D	59	77	89

Using ArcGIS Spatial Analyst tools, a composite CN value for each drainage basin was computed based on area weighting of hydrologic soil group within the subbasin as:

$$CN_{composite} = \frac{\sum A_i CN_i}{\sum A_i}$$

The initial abstraction is generally approximated by the following empirical equation:

$$I_a = 0.2S$$

However, with consideration of numerous natural depressed areas and elevated irrigation canals within the study area, adjustment was made to initial loss based this equation. The initial loss for each subbasin was modified based the existence of natural depressed areas and the elevated irrigation canals.

4.5 Soil Map

The geospatial soil data for Hidalgo County was obtained from the NRCS Soil Data Mart. The soil map layer is a polygon feature class that contains the hydrologic soil group types. **Figure 4-3** shows the hydrologic soil types within the City of Edinburg and surrounding areas. Based on the soil map, the study area consist mostly of hydrologic soil group B.

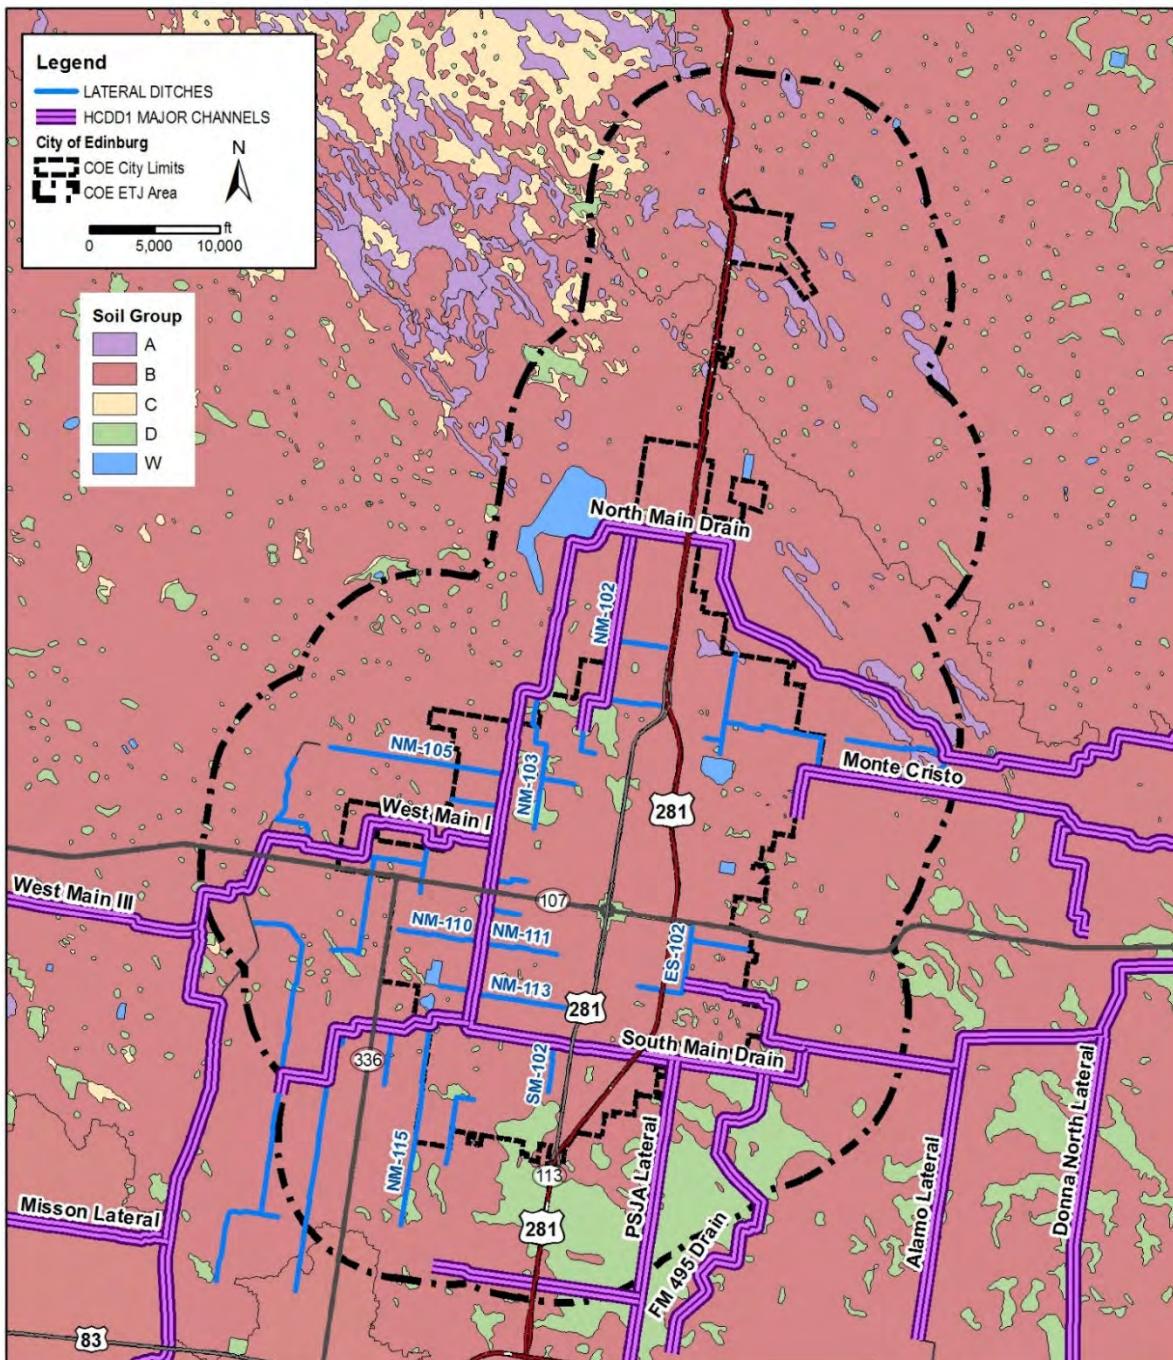

Figure 4-3. Hydrologic Soil Group Map

4.6 Land Use and Impervious Cover

Land use within a drainage basin generally has the greatest impact on the rainfall – runoff relationship. Land use and land cover dictate the percent impervious area of a drainage basin. The land use layer is a polygon feature class that contains land use type and cover and percent impervious cover information. A composite percent impervious cover for each drainage area was computed. The land use and land cover were classified into eight (8) groups for this study, as listed in **Table 4-3**.

TABLE 4-3. LAND USE TYPE VS PERCENT IMPERVIOUS COVER

LAND USE TYPE	LAND USE DESCRIPTION	IMPERVIOUS (%)
U	Undeveloped areas	0
RS	Residential < 1 acre	40
RL	Residential Large > 1 and < 5 acres	20
RR	Residential Rural > 5 acres	5
T	Transportation corridors and streets, etc.	90
W	Water bodies, streams, lakes, reservoirs, etc	100
GA	Green Areas	10
HD	Commercial, Industrial, Schools	85

The land use layer was developed based on the parcel maps from the Hidalgo County Appraisal District. The parcel maps were verified based on latest aerial photography. **Figure 4-4** shows the land use classifications within the City of Edinburg and surrounding areas.

The existing percent impervious cover values for each subbasin were modified to reflect the projected ultimate land use assuming a 30-year planning horizon. Based on the existing level of development within the study area and the expected growth rate within the region, a fully developed ultimate condition was considered for the project study area.

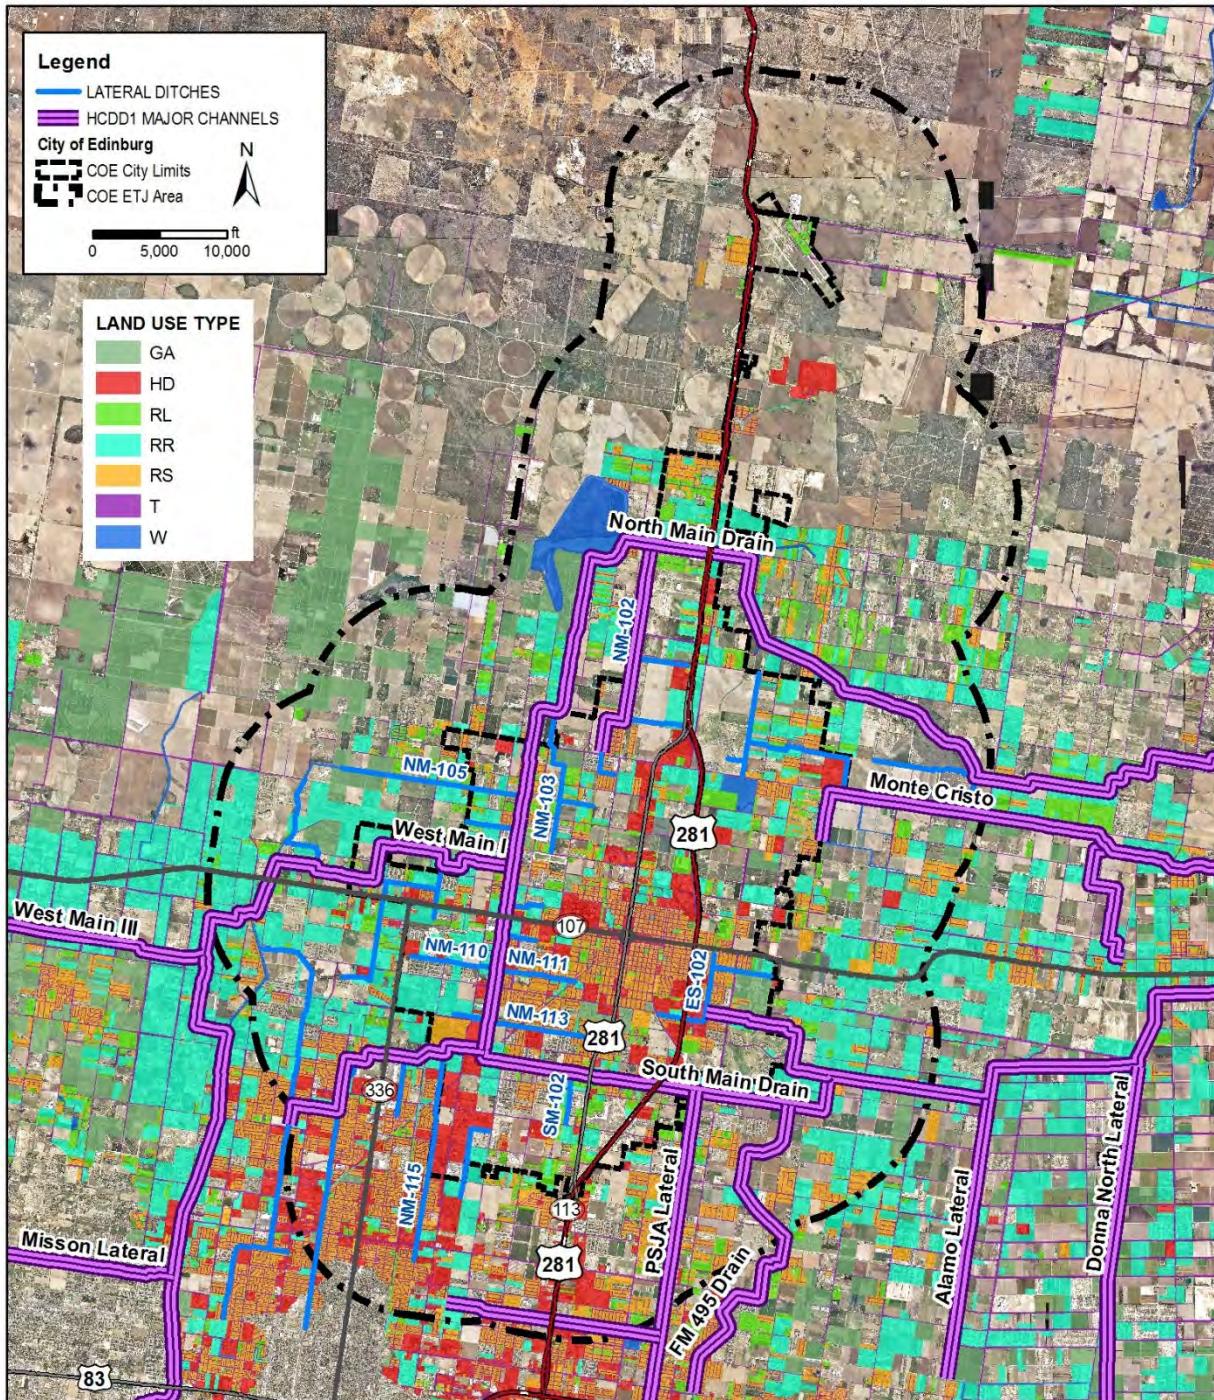

Figure 4-4. Land Use Map

4.7 Lag Time

The lag time represents the time difference between hyetograph center of mass to the peak of the hydrograph for a subbasin. Due to the natural conditions of the watershed, including the relatively flat overland slope, lack of natural channel flow, and the presence of numerous natural

depressions, the SCS (NRCS) Lag Time equation, as shown below, was utilized to determine the subbasin lag time.

$$t_p = \frac{L_w^{0.8} \left[(1000/CN) - 9 \right]^{0.7}}{31.67 S^{0.5}}$$

where: t_p = the lag time in minutes, L_w = the length of the longest flow path in feet, S (%) = the slope of the longest flow path, and CN = the composite curve number.

4.8 Unit Hydrograph

4.8.1 NRCS Dimensionless Unit Hydrograph

The standard NRCS dimensionless unit hydrograph (DUH) has been widely used to construct synthetic unit hydrographs by many agencies for hydrologic design practices and studies. The standard dimensionless unit hydrograph was an “averaged” hydrograph derived from a large number of natural unit hydrographs from watersheds ranging in sizes and geographical locations. The average DUH assumes that 37.5 percent of the total runoff volume occurs in the rising side of the curvilinear hydrograph (or the receding time from the peak is 1.67 times of the time to peak). Based on this assumption and with consideration of unit conversion factors in the equation (such as square miles to acres, acre to cubic feet, and hour to seconds) in peak discharge computation, a standard peaking rate factor (PRF) of 484 was derived as shown in the following equation:

$$Q_p = \frac{484A}{T_p}$$

The NRCS dimensionless unit hydrograph (DUH) is detailed in Chapter 16 of the *National Engineering Handbook, Section 4 (NEH-4), Hydrology*. The report indicates that a PRF value may range from below 100 for very flat watersheds to more than 600 for very steep watersheds. The *NEH-4* provides for the DUH shape based on a Gamma function relationship to the PRF.

A recent study entitled “*Revisit of NRCS Unit Hydrograph Procedures*” by Lamar University, University of Houston, and Texas Tech University for Texas Department of Transportation presents regional regression equations developed for basin-mean time to peak T_p , and peak discharge Q_p of Gamma unit hydrographs based on 1,600 recorded rainfall-runoff data pairs from 90 Texas watersheds within Trinity River, Brazos River, Colorado River, San Antonio River. The study found that the mean peak rate factor for Texas watersheds range from 251 to 626 with an average value of 370.

The U.S. Bureau of Reclamation (USBR) developed a dimensionless unit hydrograph for drainage design purposes for a project entitled “Valley Gravity Project” in 1948. The dimensionless unit hydrograph was developed by averaging two study areas with 48.56 and 22.83 square miles

respectively within the Lower Rio Grande Valley. By examining the dimensionless unit hydrograph, a NRCS DUH PRF value of 130 was determined. Based on the aforementioned studies, it can be concluded that a constant factor of 484 does not reflect the peak flows from the watersheds within Hidalgo County.

A USDA-ARS Coastal study (Sheridan, et al., 1999) evaluated the PRF in eight Texas southeast coastal flat watersheds ranging from 1.0 to 19.3 square miles. Values for the PRF ranged from 174 to 476, depending watershed slope and area. The PRF was predicted by the following empirical equation:

$$PRF = 631.7A^{0.263}S^{0.882}$$

where A is drainage area in square miles and S is watershed channel slope in percent. The channel slopes of the eight watersheds used for this study vary from 0.1 to 0.37 percent.

With considering the significant changes in slopes within the watershed, the empirical equation developed by the USDA-ARS Coastal study was used for this study and a minimum peaking rate factor of 150 value was conservatively adopted. Using the equation shown above, a specific peaking rate factor was determined for each subbasin.

4.8.2 Gamma Function Based Unit Hydrograph

The Peaking Rate Factor (PRF) reflects the shape of the Unit Hydrograph. Each PRF has a unique shape of UH. Since there is no provision in HEC-HMS for changing the 484 PRF and the corresponding UH, to reflect the lower PRF values in the HEC-HMS modeling analysis, a two-parameter Gamma equation was used to fit the UH shape as recommended by NRCS. The Gamma equation has the following equation:

$$\frac{Q_t}{Q_p} = \left(\frac{t}{T_p}\right)^\alpha e^{(1-\frac{t}{T_p})\alpha}$$

Where Q_t is the discharge value at time t , Q_p is the peak discharge of the unit hydrograph, e is constant 2.7183, α is gamma equation shape factor, and T_p is time to peak.

The gamma shape factor α can be estimated using the following equation (Aron and White (1982)):

$$\alpha = 0.045 + 0.5\phi + 5.6\phi^2 + 0.3\phi^3$$

$$\phi = \frac{PRF}{645.33}$$

4.8.3 Stream Reach Routing

Stream reach routing enables the consideration of channel storage volume to attenuate hydrograph peak flows. Stream reach routing was accomplished within the contributing drainage

areas using the Muskingum Cunge 8-Point cross-section method. Typical cross-sections were obtained for each reach and input to the HEC-HMS model with a representative slope for the reach. The typical Manning's n value used was 0.045.

Stream reach routing for the North Main Drain and South Main Drain was simulated in the model using the more accurate Modified Puls method. This was possible due to the availability of the HEC-RAS model from the Raymondville Drain Flood Control Project. After convergence from several iterations (cycling) between the HEC-RAS multi-profile model and the HEC-HMS model, acceptable storage-outflow relationships were obtained from the multi-profile hydraulic model to perform Modified Puls routing for reaches along North Main Drain and South Main Drain.

4.9 HEC-HMS Model

The U.S. Army Corps of Engineers (USACE) Hydrologic Modeling Systems (HEC-HMS) version 4.0 modeling program was used to compute peak flows and hydrographs at various locations within the drainage systems for various storm events. The basin model was generated using ArcHydro and HEC-GeoHMS. Corresponding to each drainage system delineated, an HEC-HMS model was developed to peak flows and hydrographs for each frequency storm event.

5.0 HEC-RAS MODELING

The City drainage ditches were analyzed using the U.S. Army Corps of Engineers' HEC-RAS (v.4.1) hydraulic software package. Each drainage ditch system was evaluated to determine its existing conveyance capacities, identify overbank flooding risk areas and system constraints. For systems with insufficient capacity, alternative channel improvements were analyzed.

For the City outfall ditches, one-dimensional steady flow hydraulic models were created for the hydraulic analyses. The HEC-RAS model was developed by importing the geometric import file generated from HEC-GeoRAS, as discussed below, and flow data into the geometry model data. The ditch capacity analyses were performed utilizing a normal depth tailwater condition. Existing channel capacities were determined based on the existing HEC-RAS models. Alternative HEC-RAS geometry models were created using the program's channel modification tools to evaluate alternative channel improvements.

5.1 HEC-GeoRAS

HEC-GeoRAS, an ArcGIS extension, is a set of ArcGIS tools specifically designed to process DEM data to extract channel geometric data for HEC-RAS model development. Using HEC-GeoRAS requires a digital terrain model (DTM) represented by ESRI ArcGRID or triangulated irregular network (TIN). The current version of HEC-GeoRAS creates an import file, referred to as the RAS GIS Import File, which contains the channel network, channel cross-section geometry, and reach length data from a set of RAS themes and a DTM (collectively referred as the RAS Layers). The RAS themes, including stream centerlines, flow path centerlines, channel banks, and cross section cut lines, are created based on LiDAR data, channel cross section field survey data, and aerial photograph.

5.2 Manning's n-values

The channel roughness, Manning's n-values, are representative of the vegetation, flow obstruction, and overall channel/ floodplain conditions. The Manning's n-values were assigned based on field visit, photos, and aerials. For all the hydraulic models, standardize values were determined to be representative. These include a typical channel n-value of 0.045, representing the low-velocity, trapezoidal man-made ditches with vegetation growth, and an overbank n-value of 0.06, representing a mix of urbanized/residential development areas and maintained grassy areas with some limited agricultural areas.

5.3 Overbank Ineffective/ Obstructed Areas

Several of the drainage ditches either are adjacent to elevated irrigation canals or have depressed areas within the overbank areas. The high berms of the canals cause flow blockage with the

channel overbanks, and the depressed areas represent locations of non-contributing flow area to the channel conveyance. The cross section overbank data were checked against topography and aerials. Ineffective flow areas and block obstructions were added to the cross section based on topography and overland flow patterns.

5.4 Cross-Drainage Structures

The cross-drainage culverts details within the channels were obtained from field measurements and observations. The field notes and photos for lateral cross-drainage structures as well as an overall location map are provided in **Appendix B**. Each structure's size and length was incorporated into the HEC-RAS modeling for the hydraulic capacity analyses.

5.5 Proposed Improvements

For drainage ditch systems that were determined to have inadequate conveyance capacity or requiring additional infrastructure to provide for future development needs, multiple modification measures were considered to reduce the existing flooding risks. These modification measures include:

- Channel improvements
- New channel alignments
- Crossing structure improvements
- Detention basins
- Levee systems

Channel improvements were recommended for various drainage ditch segments. The proposed channel improvements reduce the potential flood damages by increasing the channel conveyance capacity and lowering the water surface elevation along the channel. Channel improvements usually include channel widening and/or deepening, removing woody vegetation, and/or concrete lining.

New channel alignments were proposed to provide drainage relief to collect runoff from existing flooding problematic areas and areas of future development.

The typical proposed channel improvement includes a trapezoidal, grass-lined channel section with 3:1 side slopes and 30-foot maintenance berms. The channel section's bottom width, slope, and depth were optimized based on conveyance needs and available outfall depth.

For ditch reaches that are to be improved, proposed stream crossing structures were proposed to accommodate the proposed channel improvements and adequately convey the fully developed flows without impediment. It should be noted that the scope of this study did not include the survey and therefore the analysis of existing structures.

Detention basin alternatives were also considered at various locations. Detention is an alternative structural solution to reduce flows within the channel and therefore reduce water surface elevations along the channels. A detention basin stores stormwater runoff temporarily and then releases the water downstream to the channel over a longer period of time when the channel can safely convey the water away.

Levee systems with pump stations were also considered as options to protect subdivisions from flooding. Levee systems can be used to block offsite runoff flowing into a subdivision. Internal floodwater must be pumped during a flood.

5.6 HCDD1 Master Drainage System

The City drainage ditches outfall into the HCDD1 Master Drainage System, specifically the Main Floodway Channel network system. The primary HCDD1 receiving ditches serving the City include the North Main Drain and South Main Drain. The North Main Drain and South Main Drain were analyzed hydraulically to establish tailwater conditions and backwater inundation for the City drainage systems, as well as potential flooding within the City from the HCDD1 ditches. The HEC-RAS modeling for the North Main Drain and South Main Drain, as described below, is provided in **Appendix C**.

5.6.1 North Main Drain

The North Main Drain was modeled using 1D steady HEC-RAS model as part of the Raymondville Drain Flood Control Project for HCDD1. The North Main Drain receives runoff from the western and northern portions of the City of Edinburg, as well as from the majority of this project's studied outfall ditches. The model was updated based on a combination of 1D channel and 2D floodplain unsteady modeling approach with the latest 2D unsteady HEC-RAS model (v.5.0 Beta) program. The widespread floodplain along the channel was modeled by generating a 2D computation mesh based on LiDAR DEM data. Hydrographs from HEC-HMS model were incorporated into the 1D/2D unsteady flow model as boundary conditions. The results provided a more detailed representation of overbank and low depressed area flooding potential along North Main Drain within the City. The 100-year, 25-year, and 10-year inundation depth results are shown in **Figures 5-1, 5-2, and 5-3**, respectively.

As shown in the figures, areas along the North Main Drain and Lull Drain within the northern portions of the City are susceptible to inundation, even during a 10-year storm event, as well as the low-lying areas within the City Center, previously referenced as the "Edinburg Low".

5.6.2 South Main Drain

The South Main Drain was modeled using 1D steady HEC-RAS model as part of the Raymondville Drain Flood Control Project for HCDD1. Since the original HEC-RAS model was not geo-referenced

and only three of the studied outfall ditches drain to the South Main Drain system, a 2D unsteady HEC-RAS model was not created for this ditch.

6.0 DRAINAGE SYSTEM EVALUATION

This section presents the results of the detailed hydraulic analysis for both existing and proposed conditions. The existing City drainage ditches were evaluated for capacity adequacy and to identify problematic flood areas. The drainage systems were analyzed using HEC-HMS to compute runoff flows and HEC-RAS to compute capacity and water surface elevations. The drainage system investigation and evaluation included the City drainage ditch systems, as well as the associated receiving HCDD1 Master Drainage Systems. Specifically included in the discussions are descriptions of each drainage ditch system and service area, structural crossings, existing ditch capacities, drainage and flooding problems, and recommended improvements to address potential flooding problems. The HEC-RAS modeling for the lateral drainage system evaluations is provided in **Appendix D**. The resulting water surface elevation comparison between the existing and proposed water surface elevations for existing and ultimate multiple frequency flows is provided in tables within each respective subsection.

To relieve existing flooding, increase ditch capacity, and/or provide for future development, improvement alternatives were analyzed and recommended. The proposed alternative components included channel improvements, new channel alignments, crossing structure improvements, and detention basins, as previously discussed in **Section 5.4**.

6.1 Investigated City Drainage Systems

A total of twenty-one (21) City drainage systems were studied and hydraulically modeled, which are listed **Table 6-1** and shown in **Figure 6-1**. The City drainage ditch systems were categorized and labeled based on the receiving HCDD1 drainage system: NM = North Main Drain, SM = South Main Drain, ES = Edinburg Stub, and MC = Monte Cristo Drain. Details of the investigated drainage systems are presented in the following subsections. Several systems are presented together based on interaction between the systems, proposed measures, and geographic location.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

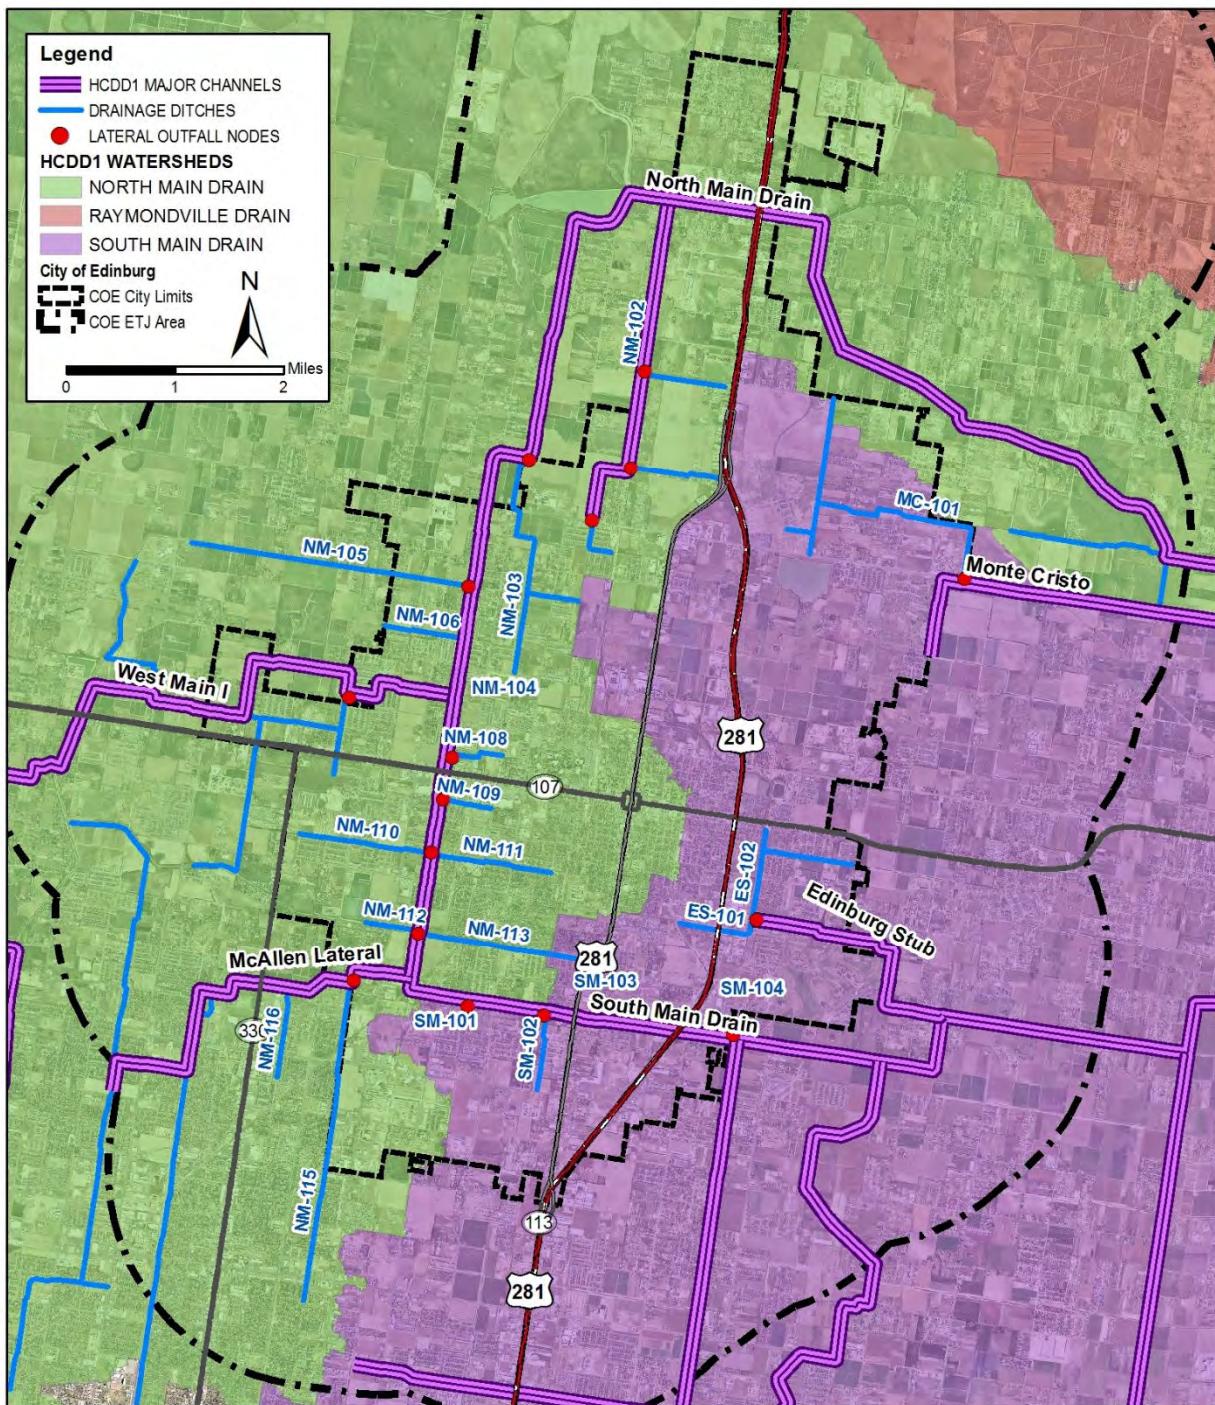

Figure 6-1. COE Drainage Ditch Systems

SYSTEM NM-102

System NM-102 represents the contributing drainage area for the HCDD1 Lull Drain and its laterals. Lull Drain is a part of the HCDD1 Master Drainage System. The drainage area is located within the northern portions of the City of Edinburg; generally between North Main Drain to the west and US 281 to the east. The system drains from south of W. Monte Cristo St. north to the North Main Drain with a total drainage area of approximately 3214 acres (5.02 sq. miles).

The drainage network consists of approximately 28,300 feet of ditches including the Lull Drain (NM-102), which serves as the main drainage ditch, and recently constructed (within ten years) laterals to service specific developments. Laterals NM-102-01 and NM-102-02 run west to Lull Drain and service US 281 (IH-69). Lateral NM-102-03 runs south from Lull Drain and services the Monte Cristo Park, Solana, and Las Cruces subdivisions which lie between Rogers Road and Monte Cristo Road. The NM-102 system drainage area and ditch alignments are shown in **Figure 6-2**.

The City has identified the Lull Townsite Subdivision, which is located along Lull Drain adjacent to Monte Cristo Road, to be a flooding prone area. This subdivision is located within a low-lying topographic area, as shown in **Figure 6-3**. Based on the North Main Drain hydraulic analysis, the 10-year water surface elevation within North Main Drain equates to the natural elevations along Lull Drain near Monte Cristo Road. As shown in the figures in Section 5.5, the area around Lull Subdivision is inundated during the 10-year and greater storms by the backwater from North Main Drain.

The hydraulic analysis shows that the Lull Drain system has a greater than 25-year capacity within the lower (northern) reaches and less than 10-year capacity within the reach along Lull Townsite Subdivision (downstream/north of Monte Cristo Road). The hydraulic analysis shows that the downstream Access Road and the Denver Road culverts require replacement to provide adequate conveyance for the proposed conditions. The following table lists the existing and proposed structures.

TABLE 6-2. NM-102 SYSTEM CROSS-DRAINAGE STRUCTURE INVENTORY

DITCH STATION	CROSSING NAME	EXISTING STRUCTURE	CULVERT LENGTH	PROPOSED STRUCTURE
NM-102				
1822	ACCESS	72" RCP	100	10' X 6' RCB
17433	MONTE CRISTO	60" RCP	554	--
18586	DENVER	36" RCP	93	2-36" RCP

The Lull Drain tailwater conditions from North Main Drain imply that any channel improvements along Lull Drain to increase the existing capacity will not result in significant benefit without improvements along North Main Drain. However, detention storage is an effective measure to provide flood relief for existing localized flooding as well as future development drainage needs.

Two alternatives are proposed to provide detention storage. One option includes inline detention within Lull Drain for the entire ditch reach. This option would provide storage needs for the existing flooding problems as well as drainage needs for future development. The option includes widening the existing channel and installing control structures such as flood gates and weir structures to prevent backwater from North Main Drain inundating the ditch system. A comparison of the improvement option existing and proposed water surface elevations from HEC-RAS modeling is provided in **Table 6-3**.

Another option is to provide an offline detention basin to relief localized flooding within the Lull Townsite Subdivision and adjacent areas. The two proposed alternatives are shown in **Figure 6-3**.

The Edinburg ISD has identified the Edinburg North High School campus as a flood risk area of concern. The campus is located along Closner Blvd. (BS 281) south of Monte Cristo Rd. within the upper reaches of the Lull Drain drainage area. The high school is currently drained by storm sewer systems. In order to provide additional drainage relief to the campus, it is recommended that the upstream reach of the Lull Drain (NM-102-03) be extended east from Brenda Road to the high school. The ditch extension would be approximately 1500 feet in length and consist of 10-foot bottom width, 3:1 (H:V) side slopes, and approximately 6 feet in depth. The ditch extension alignment is shown in **Figure 6-3**.

As part of the proposed Raymondville Drain Flood Control Project, flow will be diverted from North Main Drain near the Lull Drain confluence. These improvements project could significantly lower the tailwater condition for Lull Drain and reduce the ponding along the ditch. Any improvements to relieve existing flooding potential and provide drainage infrastructure needs for future development within this drainage system will depend on HCDD1 drainage improvements such as the Raymondville Drain Flood Control Project.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

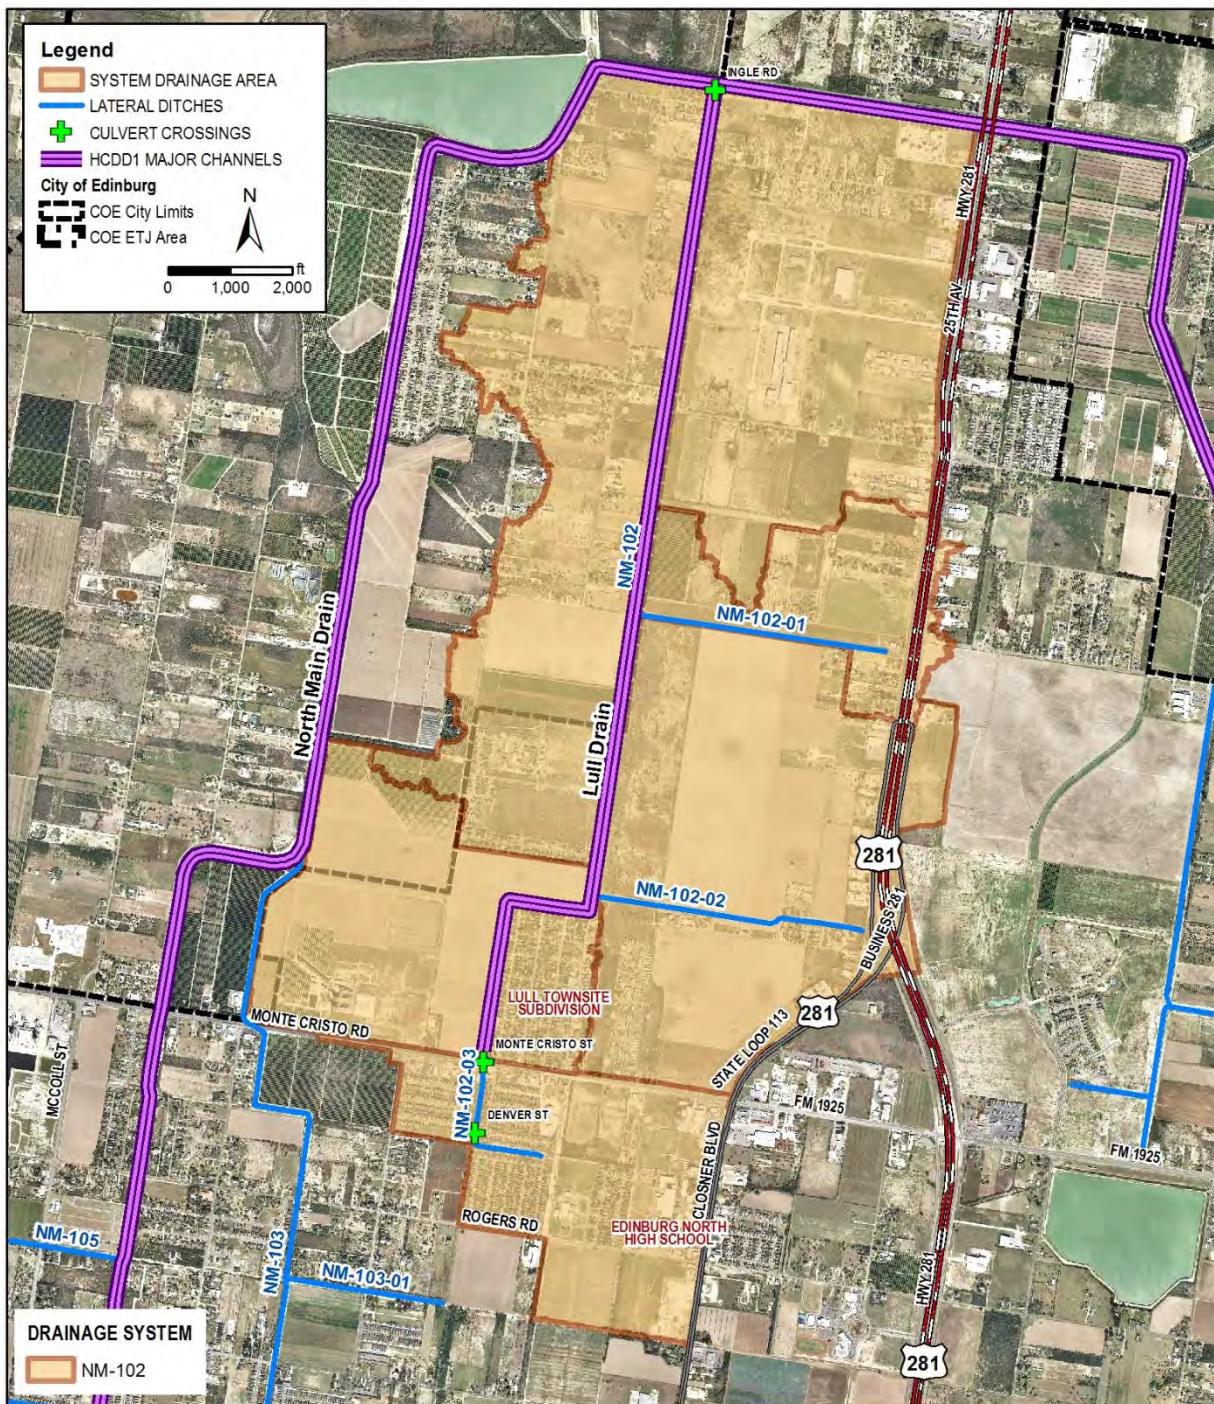

Figure 6-2. NM-102 Drainage System

CITY OF EDINBURG
MASTER DRAINAGE PLAN

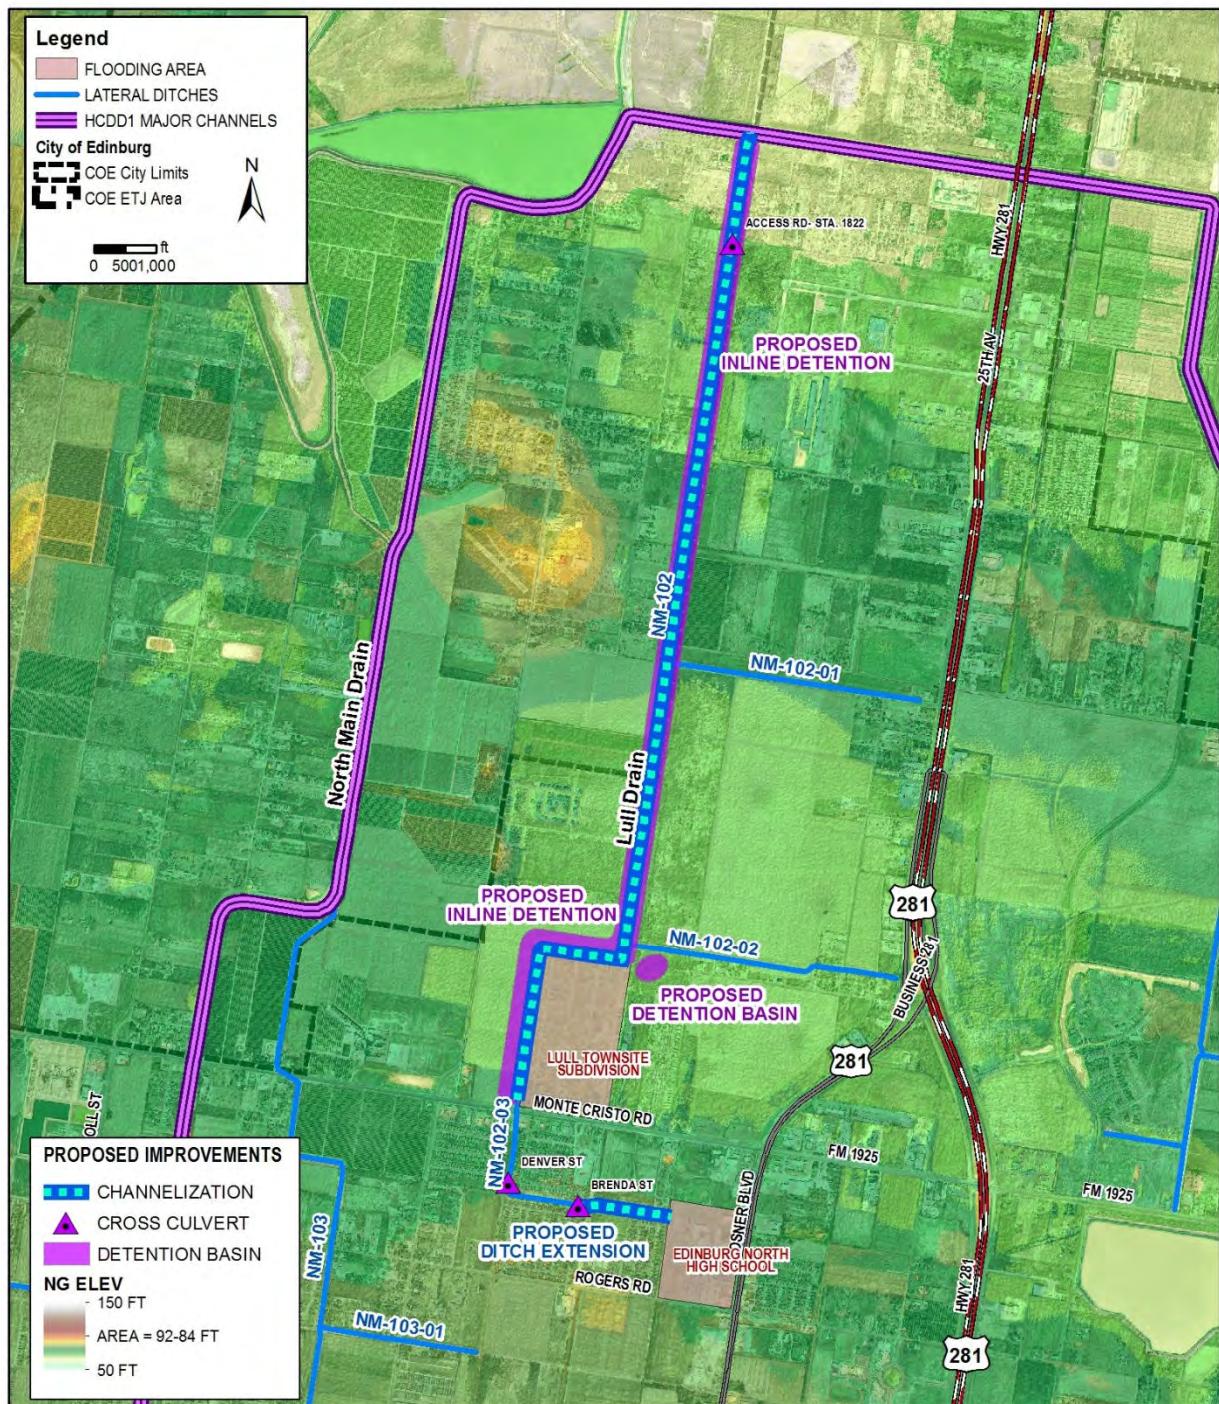

Figure 6-3. NM-102 Proposed System Improvements

SYSTEMS NM-103 & NM-104

System NM-103 represents the contributing drainage area of a lateral ditch to North Main Drain within the northern portions of the City of Edinburg and its ETJ. The area is generally located east of North Main Drain, west of Sugar Road, south of Monte Cristo Rd., and north of University of Texas-Pan American and W. Chapin St. The system drains from Chapin St. north to the North Main Drain with a total drainage area of approximately 903 acres (1.41 sq. miles). The drainage network consists of approximately 14,700 feet of ditches including the NM-103 mainstem (12,200 feet) and NM-103-01 lateral (2500 feet). The NM-103 system drainage area and ditch alignments are shown in **Figure 6-4**.

System NM-104 represent the contributing drainage area to the City of Edinburg storm water detention basins located at Chapin St. and Sugar Rd. The drainage area includes portions of the City central area, such as the University of Texas – Pan American (UTPA) campus and areas along Schunior St. and University Dr. The contributing area of this system is located within the natural flow path of the Edinburg Low. The area is collected by existing storm sewer systems that are pumped in to the City storm water basin. The storm water basin discharges into a storm sewer system along Chapin St. and outfalls into North Main Drain. The NM-104 system drainage area is shown in **Figure 6-4**.

A HEC-RAS model was developed to analysis the NM-103 system ditches for capacity. Based on the HEC-RAS hydraulic modeling, the NM-103 has a 100-year capacity along its reach. However, the North Main Drain tailwater condition dictates the flooding along the ditch. Based on the overland topography, the NM-103 system is located within the Edinburg Low flow path area. Additionally as shown in the hydraulic analysis presented in Section 5, NM-103 is subjected to overbank and backwater flooding from the North Main Drain for the 10-year and greater storm events. The overland topography and North Main Drain high water surface elevations reduce the conveyance capacity of the NM-103 channel.

The hydraulic analysis shows that the NM-103 system has a less than 25-year capacity along the channel. The hydraulic analysis shows that the culverts along the ditch require replacement to provide adequate conveyance for existing and future proposed conditions. The existing and proposed structures are listed in **Table 6-4**. A comparison of the existing and proposed improvement water surface elevations from HEC-RAS modeling is provided in **Table 6-5**.

TABLE 6-4. NM-103 SYSTEM CROSS-DRAINAGE STRUCTURE INVENTORY

Based on received public comments, the residential area along Carmen and Greenfield Roads, east of N. Sugar Road has been identified as a flooding area. Investigation of the area shows there is no significant drainage outfall to collect overland runoff contributing along Sugar Road. It is recommended that a proposed outfall be constructed to convey the Sugar Road drainage to the NM-103 ditch. Another alternative to provide drainage relief for the area is to route the runoff contributing to Sugar Road to the existing storm water basin (or a proposed basin as described below) located south of W. Chapin St.

Flooding has historically plagued the City central area within the NM-104 system area due to the low-lying topography, limited relief and outfall capacity, and tailwater conditions within North Main Drain. The City of Edinburg has a storm water retention basin along W. Chapin St, immediately south of NM-103 ditch. The retention basin provides storage for the City storm sewer systems within the NM-104 system area. The retention basin is currently pumped to North Main Drain along W. Chapin St. Additional relief for the retention basin can be potentially provided by a proposed discharge connection across W. Chapin St. into NM-103. An additional alternative includes increasing the capacity of the storm water basin through an additional basin cell north of W. Chapin St. The proposed basin would provide increased storage capacity for the existing City storm water facility. This would reduce the tailwater of the storm sewer systems within the City central area, reducing the flooding potential. The proposed alternative options are shown in **Figure 6-5**.

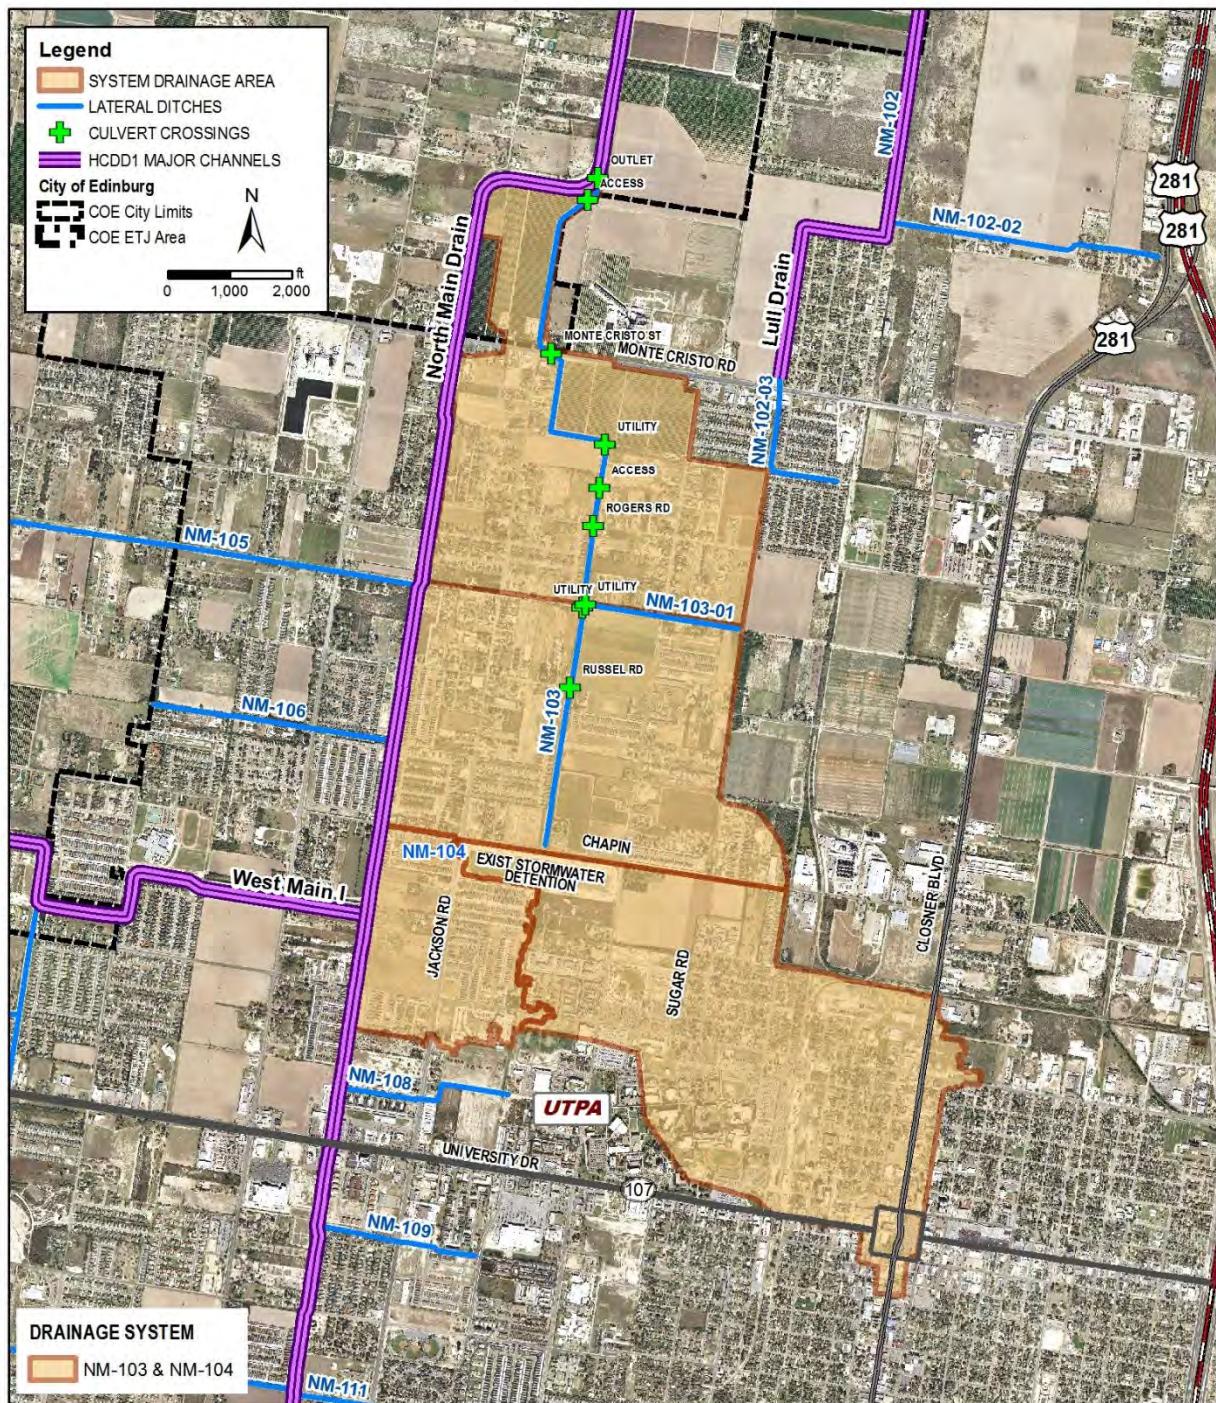

Figure 6-4. NM-103 & NM-104 Drainage System

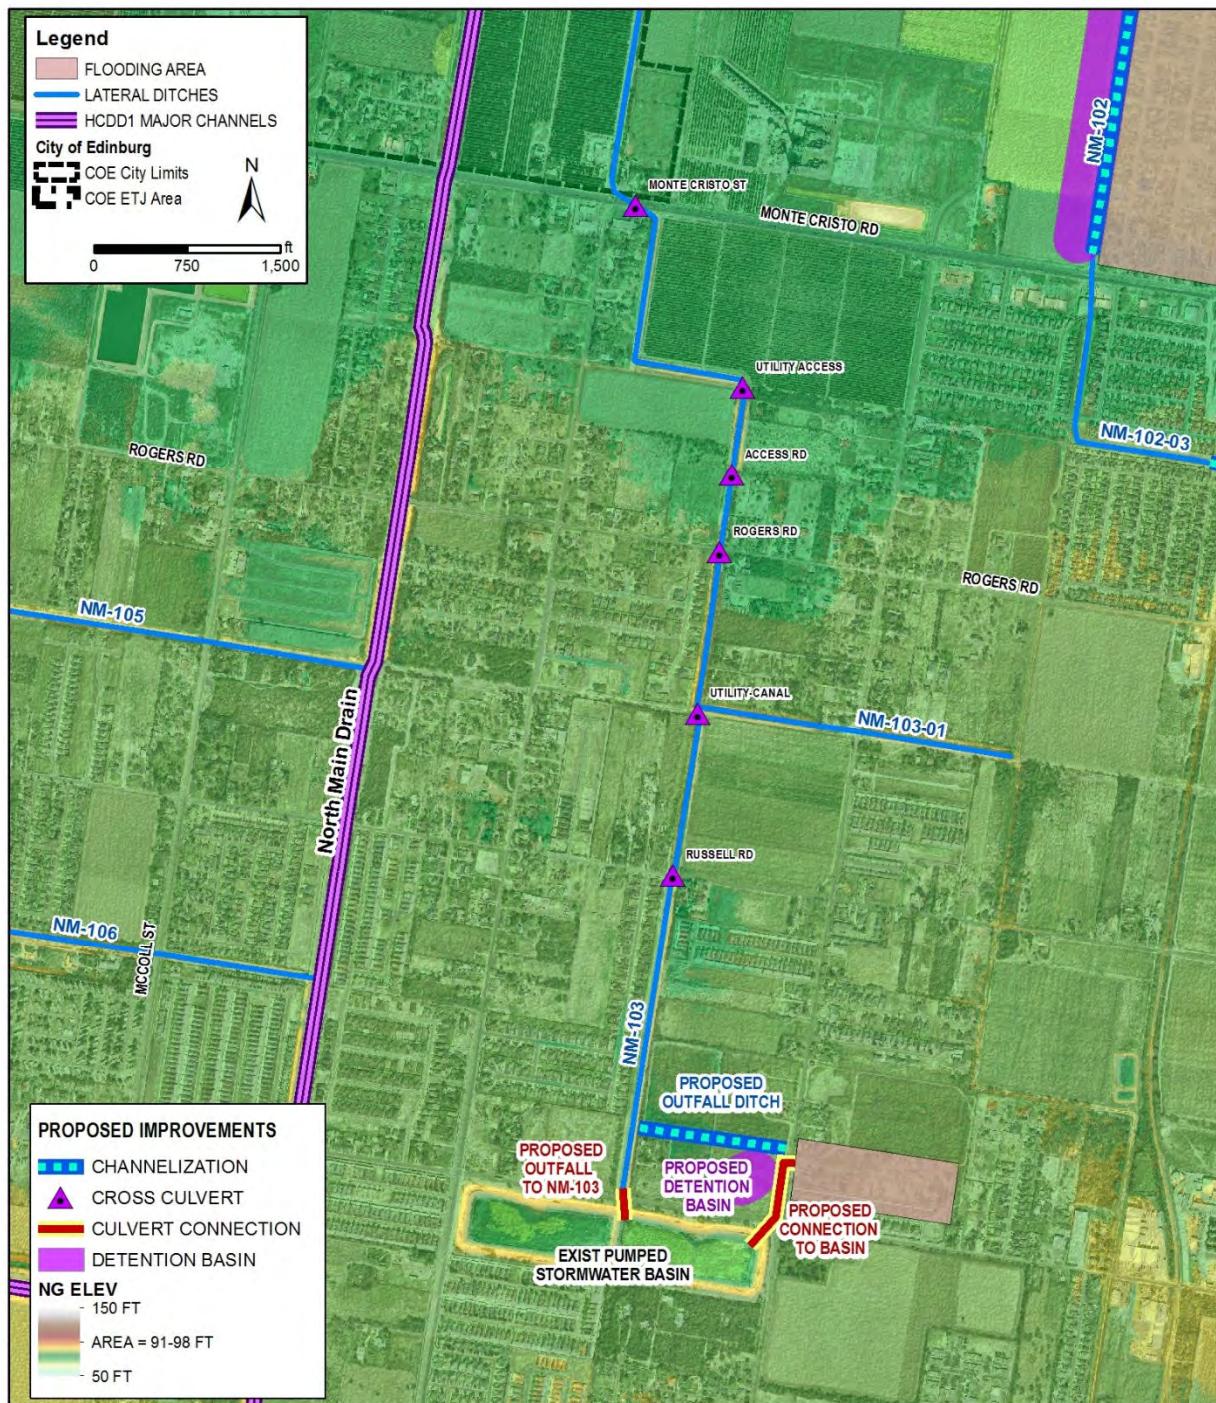

Figure 6-5. NM-103 & NM-104 Proposed System Improvements

SYSTEMS NM-105 & NM-106

Systems NM-105 and NM-106 represent the contributing drainage areas to North Main Drain and local laterals located within the northwest portions of the City of Edinburg and its ETJ. The area is generally west of North Main Drain, north of West Main I Drain, east of HCID canal, and south of W. Rogers Road. The system drainage areas are approximately 942 and 518 acres, respectively. The drainage network consists of a single ditch for NM-105 (13,800 feet) and NM-106 (3900 feet). The NM-105 and NM-106 system drainage area and ditch alignments are shown in **Figure 6-6**.

The drainage areas overland topography runs from west to east towards the North Main Drain at an approximate slope of 0.15%. The eastern, downstream areas of the ditch systems are susceptible to backwater effects from the North Main Drain water surface elevation during large storm events.

The NM-105 ditch has high channel banks with low-lying overbank areas located within the current undeveloped reaches. The contributing drainage area to NM-105 is located south of the channel and consist of a mixture of residential development, which is located mostly in the downstream reaches, and undeveloped agricultural lands. The Elias Longoria Middle School, which was recently constructed, is located at the upstream end of the ditch.

The NM-106 ditch has high channel banks along its entire reach. The majority of the contributing drainage area is located upstream of the existing NM-106 ditch and is conveyed to the channel either by sheetflow or roadside ditches. The area consist of residential development located along Monument Mack Road and undeveloped areas within the upstream reaches.

HEC-RAS models were developed for each ditch to analyze the systems' capacities. Based on the HEC-RAS hydraulic modeling, the NM-105 has a 25-year capacity along its reach upstream. The model indicates some out-of-bank ponding along NM-105 within the currently undeveloped, low-lying adjacent areas. The NM-106 has a 100-year capacity along its reach with some out-of-bank ponding within the adjacent, low-lying overbank areas.

The hydraulic analysis shows that the NM-105 system has a variable capacity ranging between 10-year and 100-year along the channel. The crossing structures are shown to provide significant restrictions at specific locations. The hydraulic analysis shows that the culverts at McColl Road, Monument Mack Road, and Hoehn Road require replacement to provide adequate conveyance for existing and future proposed conditions. The hydraulic analysis shows that the NM-106 system has a greater than 25-year capacity along the channel. The hydraulic analysis shows that the culverts at McColl Road and the upstream Access Road require additional culverts to provide

for future conveyance capacity. The existing and proposed structures for the NM-105 and NM-106 systems are listed in **Table 6-6**.

For future development outfall, drainage laterals and extensions are proposed within the NM-105 and NM-106 drainage areas, as shown in **Figure 6-7**. A lateral ditch is proposed within the upstream portion of the NM-105 drainage area; the ditch configuration consist of an 10-foot bottom width, 3:1 (H:V) side slopes, and 8-foot depth. The NM-106 ditch is proposed to be extended west with a 10-foot bottom width, 3:1 (H:V) side slopes, and 8-foot depth. Comparisons of the existing and proposed condition water surface elevations for the NM-105 and NM-106 ditches are provided in **Tables 6-7** and **6-8**, respectively.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

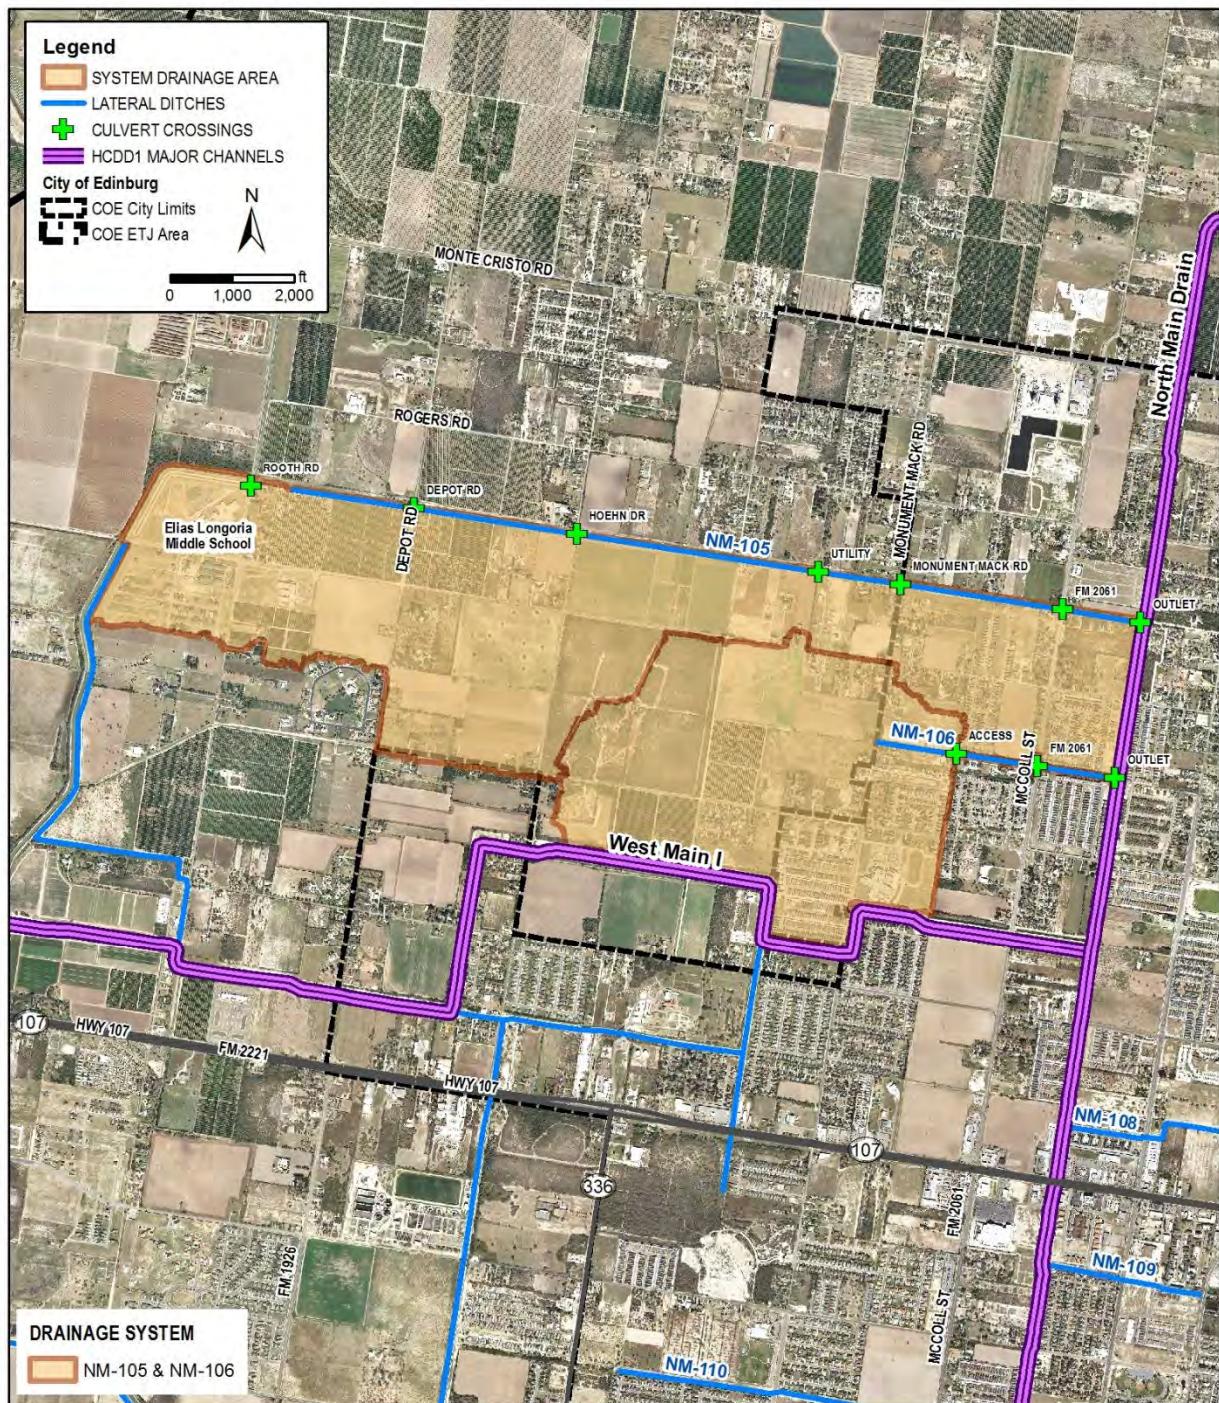

Figure 6-6. NM-105 & NM-106 Drainage Systems

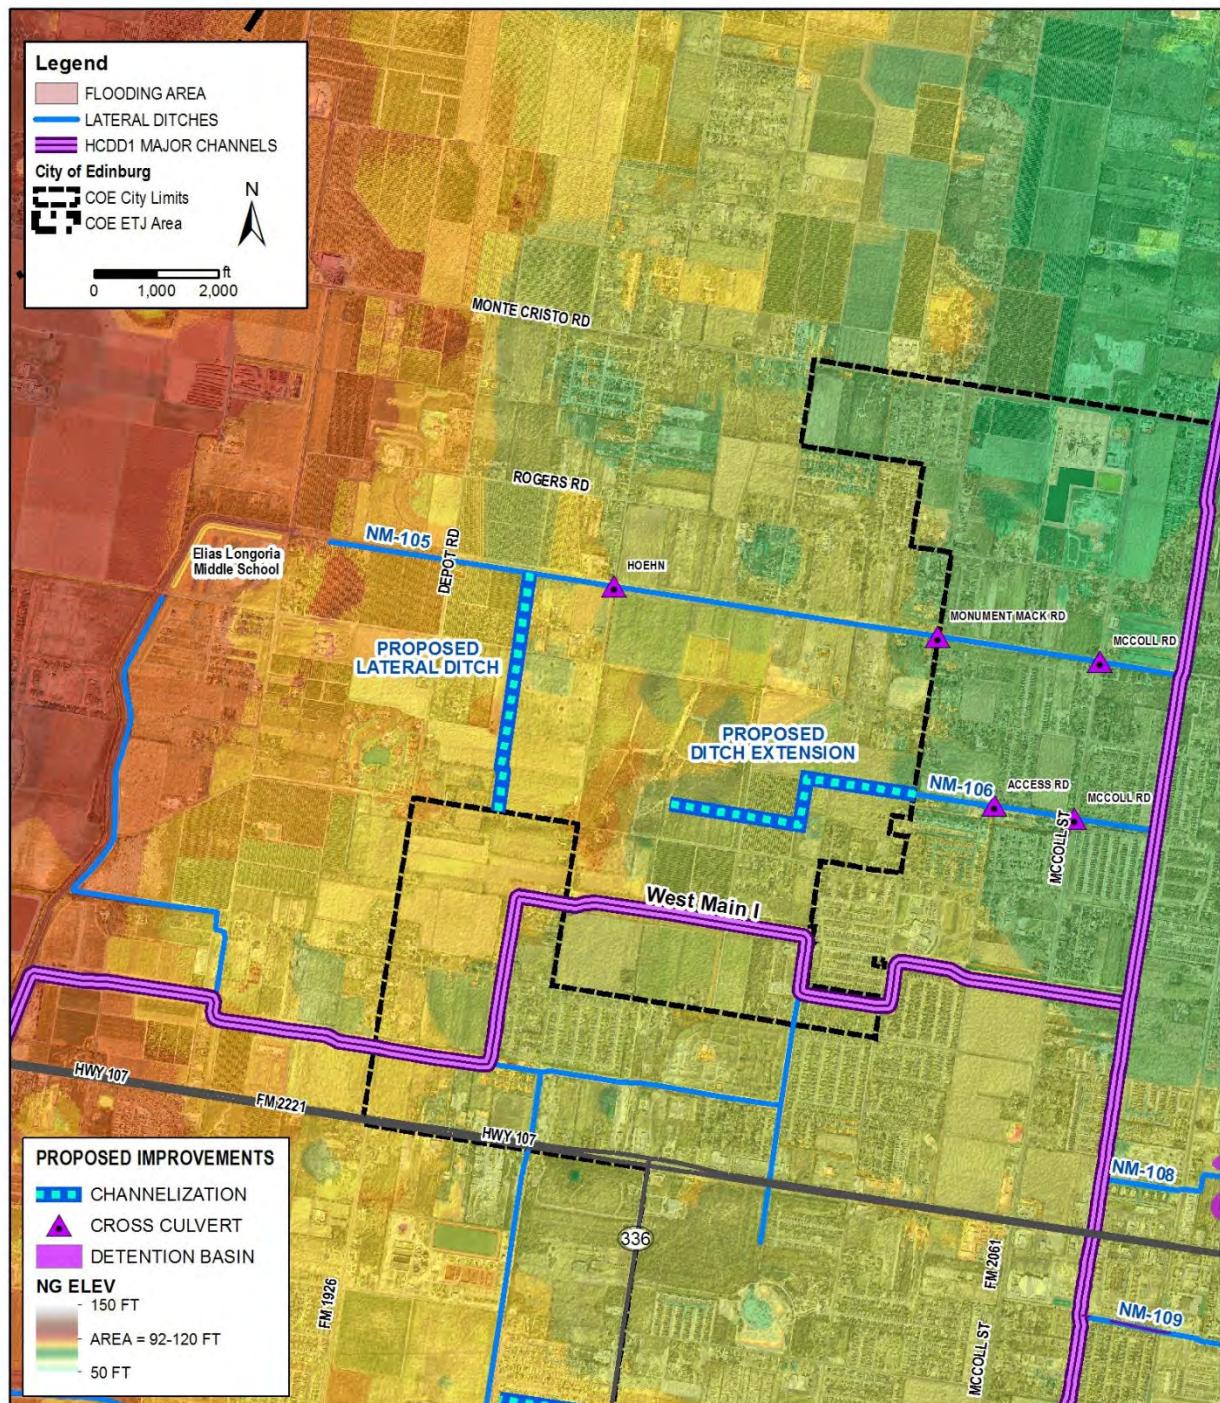

Figure 6-7. NM-105 & NM-106 Systems Improvements

SYSTEMS NM-108 & NM-109

Systems NM-108 and NM-109 represent the contributing drainage areas to North Main Drain and local laterals located within the western portions of the City of Edinburg. The area is generally east of North Main Drain, north of South Main Drain, south of SH 107 (W. University Dr.) and west of US 281B (S. Closner Blvd). The system drainage areas are approximately 527 and 133 acres, respectively. The drainage network consists of a single lateral ditch for each system basin with ditch lengths of 2900 (NM-108) and 2600 (NM-109) feet. See **Figure 6-8** for the drainage system area.

The existing NM-108 ditch is as an outfall for portion of the storm sewer system that serves a portion of the University of Texas – Pan American (UTPA), University Drive, and the southwest portions of the City central area. Due to the repetitive flooding issues within the downtown and UTPA areas, detention is proposed within the drainage area to provide relief for the existing storm sewer systems. The proposed detention would reduce the backwater effects associated with North Main Drain, reducing the storm sewer system tailwater conditions. The detention alternative is dependent on the land availability and acquisition cost within the highly urbanized area adjacent to UTPA. Potential basin locations, as shown in **Figure 6-9**, were based on the latest available aerial photography.

The hydraulic analysis shows that the NM-108 system has a greater than 25-year capacity for existing and future conditions. Additionally, the culvert at Jackson Road is shown to provide adequate conveyance capacity. The hydraulic analysis shows that the NM-109 system has a 25-year capacity along the channel. The existing NM-109 ditch is enclosed from S. Jackson Road to S. Pacific Ave; a total length of approximately 940 feet. Based on field measurements, this culvert is a 36" RCP. It is recommended that this culvert be enlarged to increase the conveyance capacity of the ditch system. A minimum 48" RCP is recommended for these structures. The existing and proposed structures for the NM-108 and NM-109 systems are listed in **Table 6-9**.

TABLE 6-9. NM-108 & NM-109 SYSTEM CROSS-DRAINAGE STRUCTURE INVENTORY

DITCH STATION	CROSSING NAME	EXISTING STRUCTURE	CULVERT LENGTH	PROPOSED STRUCTURE
NM-108				
1343	JACKSON	10' X 6' RCB	186	--
NM-109				
1331	JACKSON	36" RCP	940	48" RCP

Another alternative option that was investigated for the relief of the existing flooding within the NM-108 system, i.e. at UTPA and along University Drive, included the partial diversion of the University Drive storm sewer system into a basin within the mid-reach of the system. This improvement will provide storm water detention and reduce the North Main Drain backwater effects onto the existing storm sewer systems within the area. The basin would be connected to the NM-109 ditch to provide further outfall relief for the system. A detention basin location was proposed based on undeveloped, open land near University Dr., as shown in **Figure 6-9**.

Due to the extensive length of the Jackson Road culvert and the size of the contributing drainage area, this structure is sensitive to the culvert open area and the condition of the downstream channel. It is recommended that this culvert and channel approaches be maintained regularly. If the crossing roadways are improved within the future, it is recommended that this culvert be enlarged to provide additional relief to potential ponding issues within the adjacent areas upstream and to accommodate future development within the subbasin.

Comparisons of the existing and proposed condition water surface elevations for the NM-108 and NM-109 ditches are provided in **Tables 6-10** and **6-11**, respectively.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

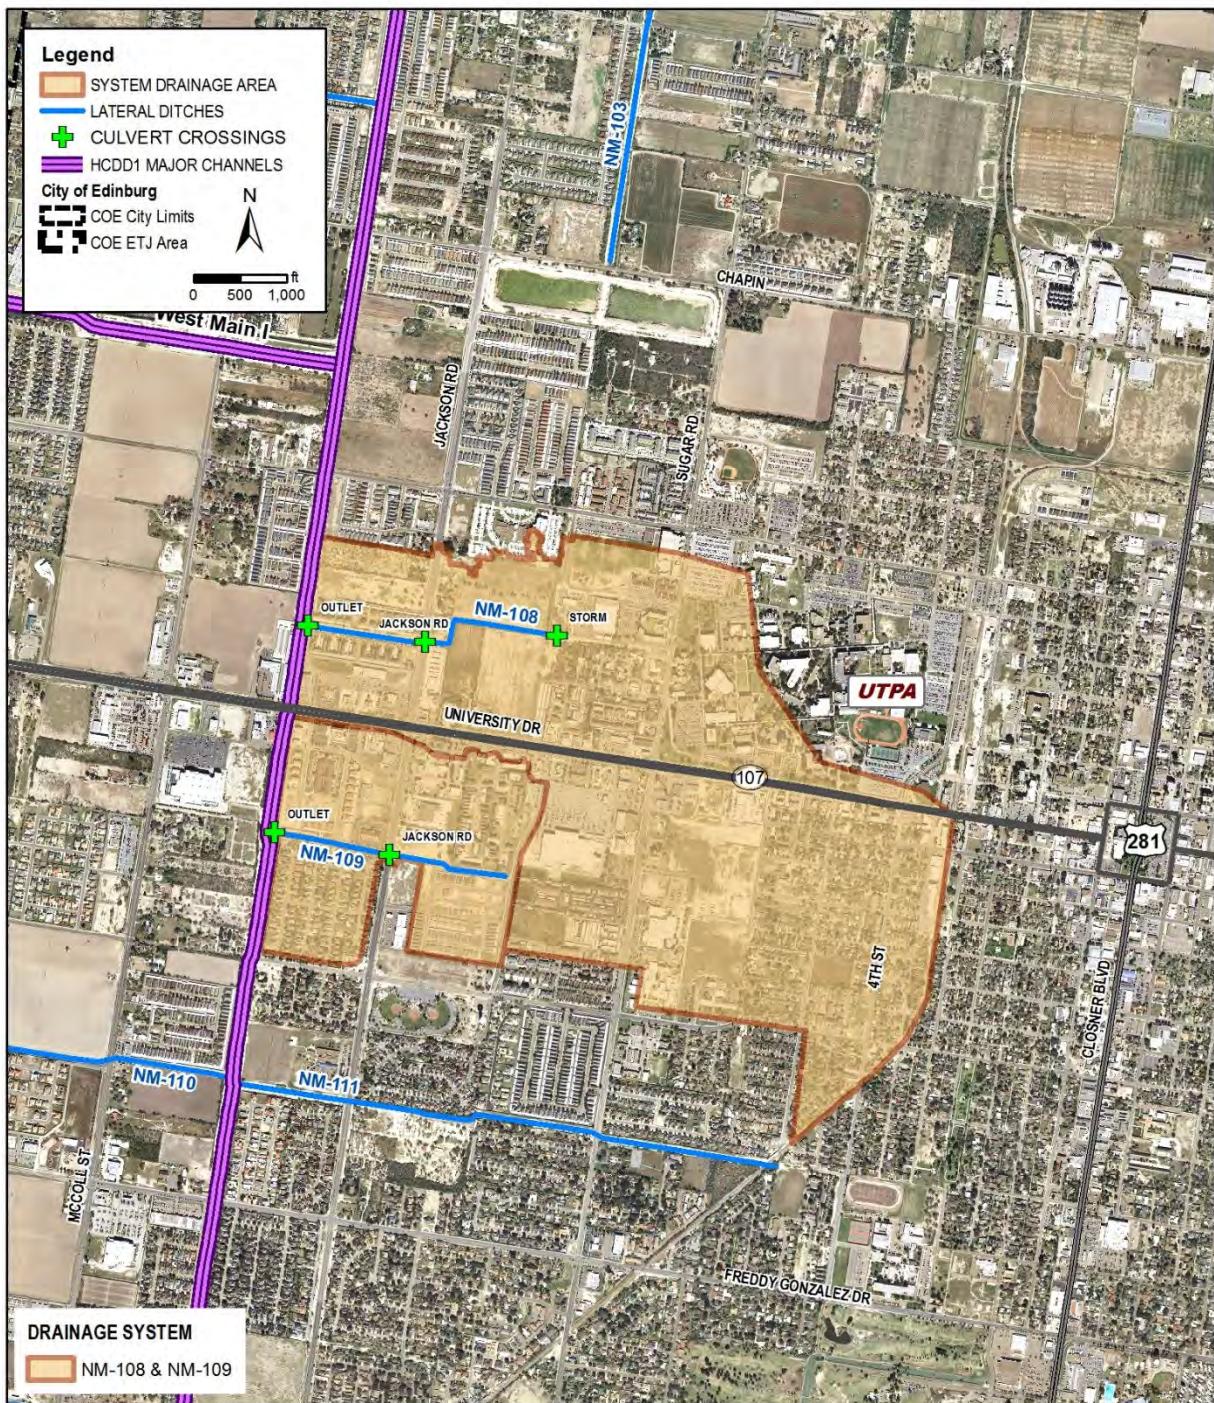

Figure 6-8. NM-108 & NM-109 Drainage Systems

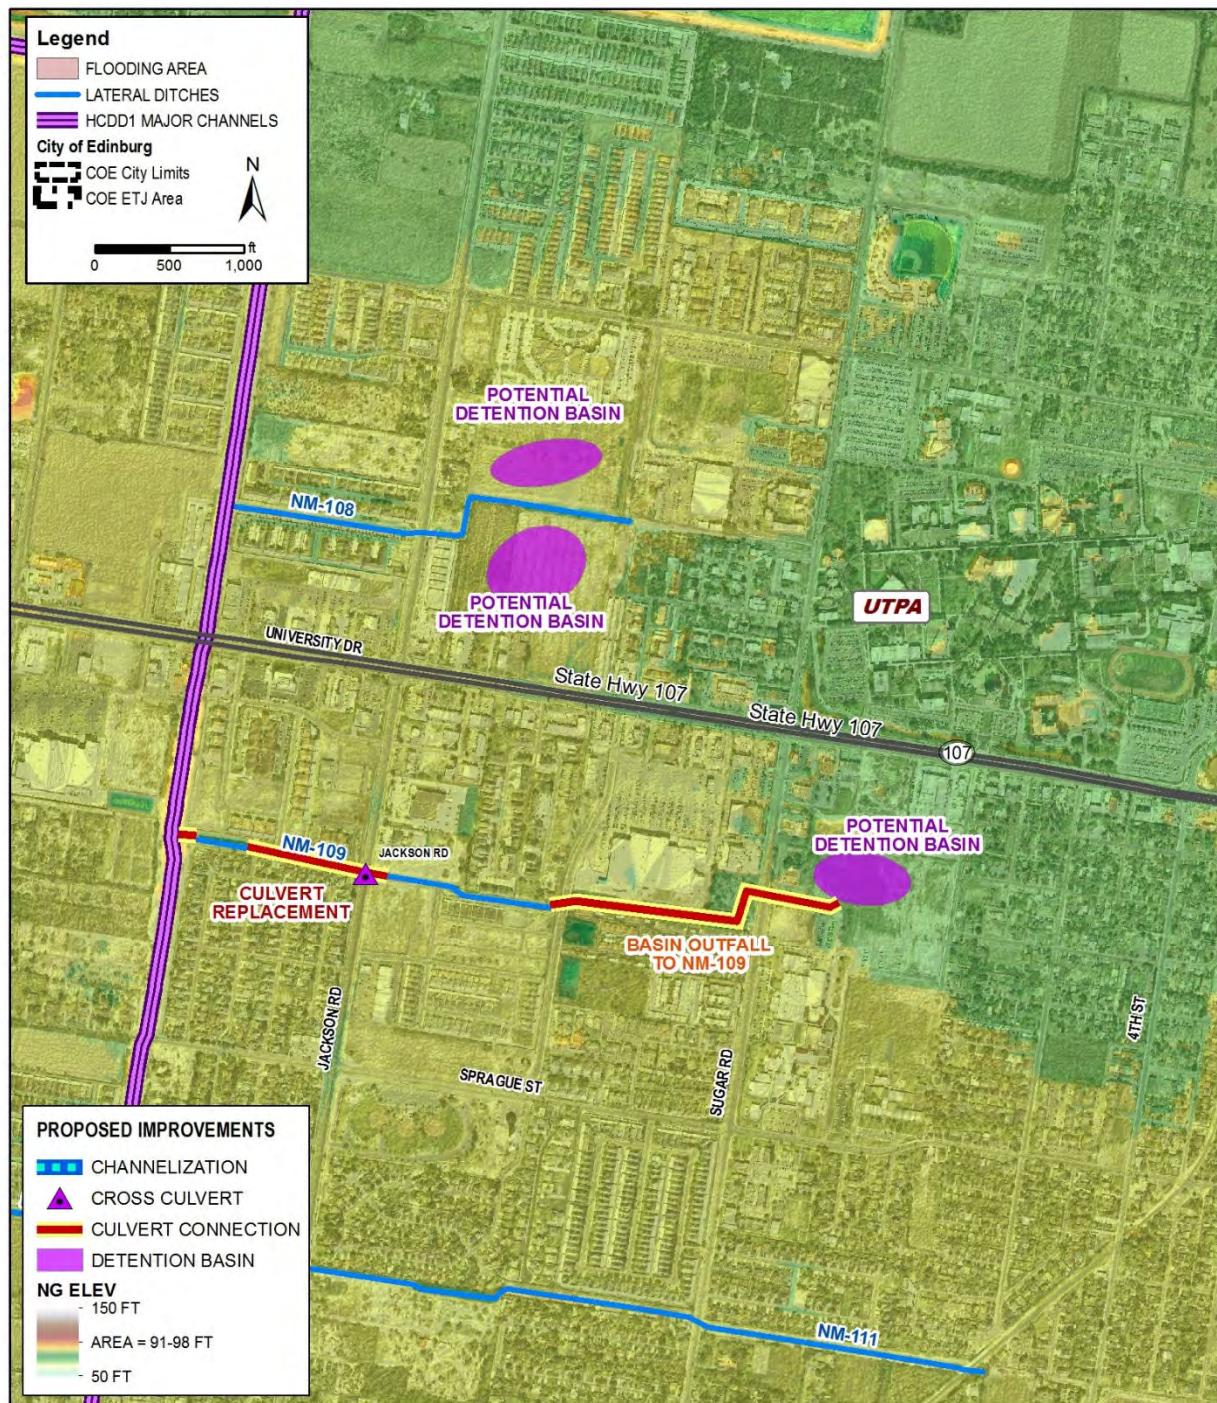

Figure 6-9. NM-108 & NM-109 Systems Improvements

SYSTEMS NM-110, NM-112

Systems NM-110 and NM-112 represent the contributing drainage areas of lateral ditches to North Main Drain within the southwest portions of the City of Edinburg and its ETJ. The areas are generally located west of North Main Drain, north of Edinburg East Main Canal, south of SH 107 (W. University Dr.) and west of Hoehn Rd. The system drainage areas are approximately 1363 and 47 acres, respectively. The drainage network consists of a single lateral ditch for each system basin with ditch lengths of 6500 (NM-110) and 6700 (NM-112) feet. Both systems drain from west to east into North Main Drain. The NM-110 and NM-112 system drainage area and ditch alignments are shown in **Figure 6-10**.

The hydraulic analysis shows that the NM-110 system has less than a 10-year capacity due to the low overbanks and the inadequate cross-drainage structures. The crossing structures are shown to provide significant restrictions along the channel. The existing McColl Road culvert consist of a 30" RCP at the upstream face, connected to an 8'x4' RCB outlet. It is proposed that the outlet box be extended upstream to increase the conveyance across McColl Road. Additionally, the upstream crossings at a utility-canal access road and Monument Mack Road be replaced and an additional pipe be provided at Saker Road. The hydraulic analysis shows that the NM-112 system has a greater than 25-year capacity along the channel. The hydraulic analysis shows that the culvert at McColl Road provides sufficient capacity for existing and future conditions. The existing and proposed structures for the NM-110 and NM-112 systems are listed in **Table 6-12**.

NM-112				
1335	MCCOLL (FM 2061)	24" RCP	220	--

There are no current identified flooding issues within the drainage system areas, as provided by the City. However, based on the overland topography there are low-lying areas within the current undeveloped properties adjacent to the drainage ditches. For any future development within this drainage area, fill will probably be necessary to provide drainage into the receiving ditches.

Based on the current level of development and no currently reported flooding issues within the drainage area, only the cross-culvert improvements along NM-110 are recommended for these systems to relieve potential flooding. For future development it is recommended that the NM-110 ditch be extended to the south to provide for drainage outfall needs, shown in **Figure 6-11**.

Comparisons of the existing and proposed condition water surface elevations for the NM-110 and NM-112 ditches are provided in **Tables 6-13** and **6-14**, respectively.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

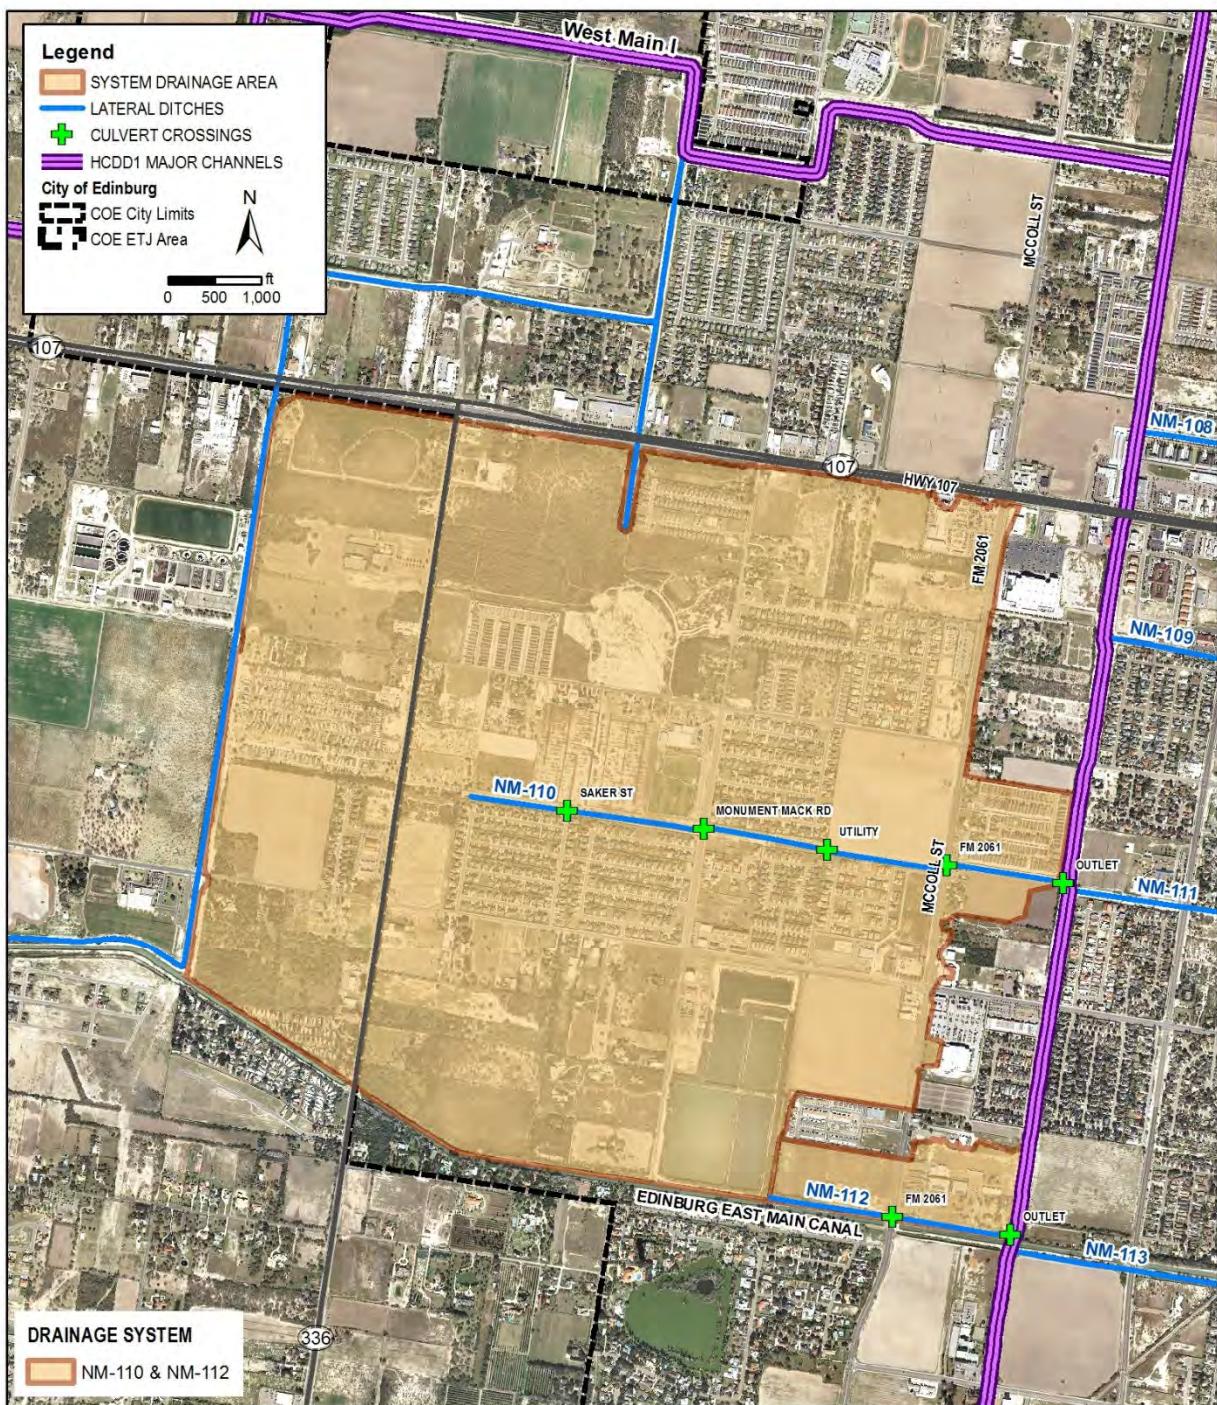

Figure 6-10. NM-110 & NM-112 Drainage Systems

CITY OF EDINBURG
MASTER DRAINAGE PLAN

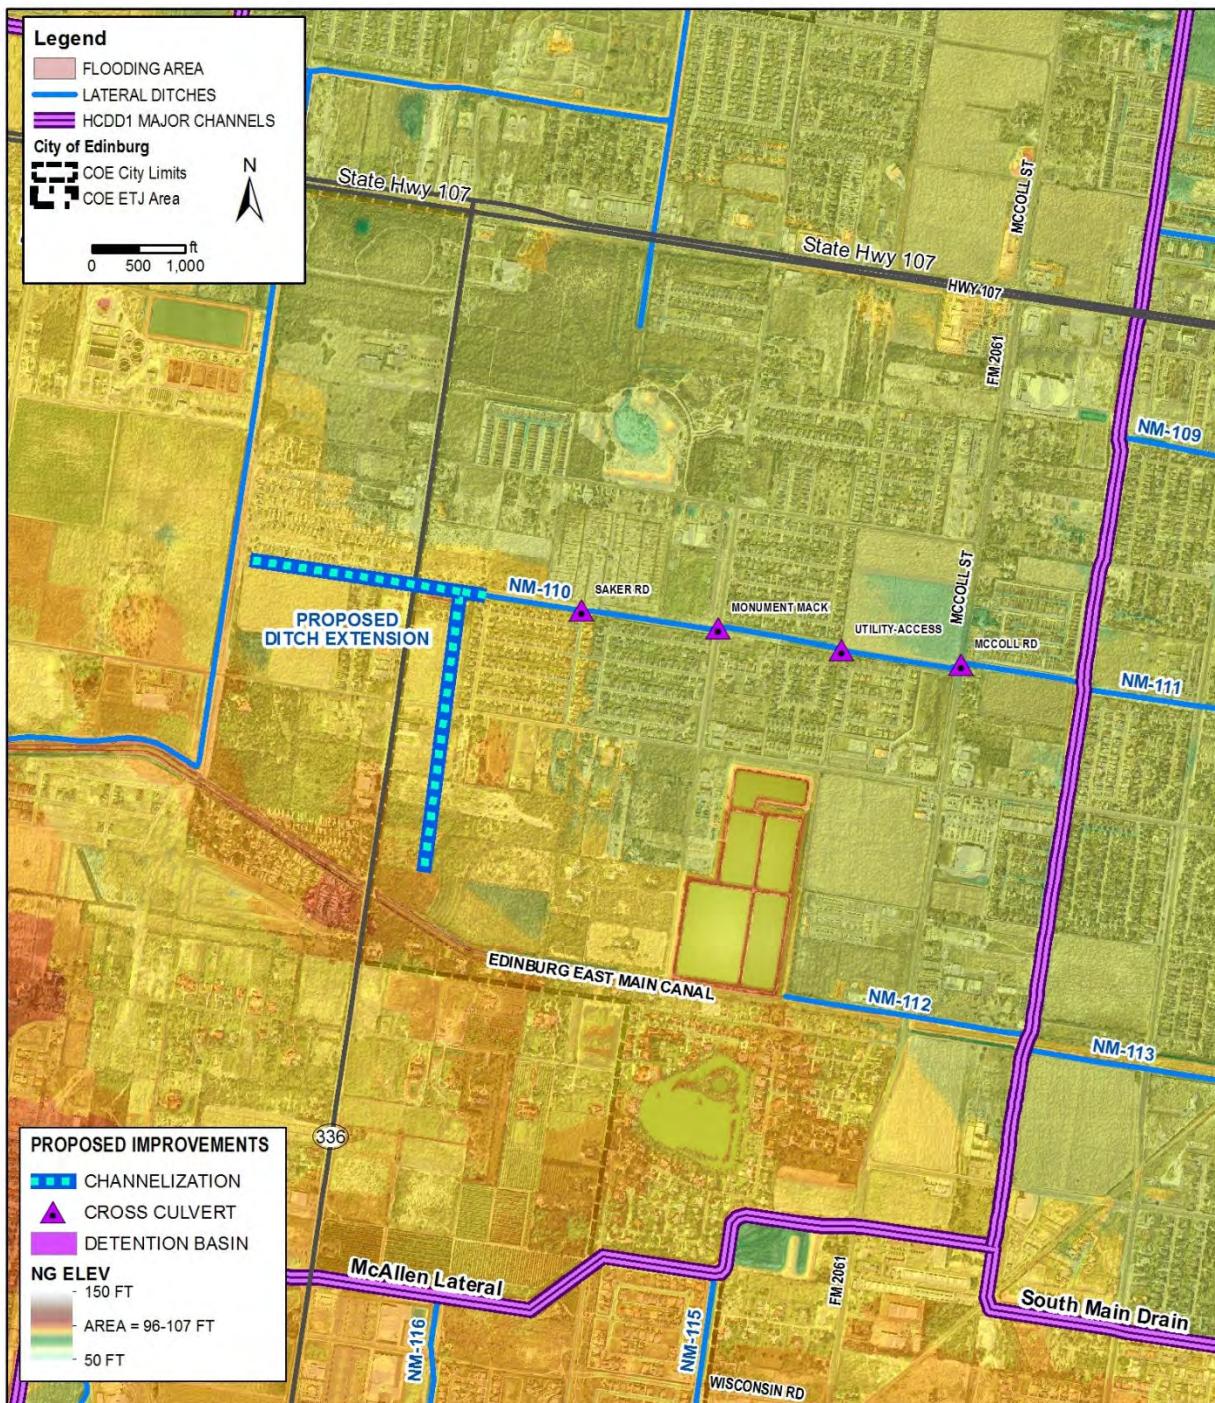

Figure 6-11. NM-110 & NM-112 Systems Improvements

SYSTEMS NM-111 & NM-113

Systems NM-111 and NM-113 represent the contributing drainage areas to North Main Drain and laterals located within the southwest portions of the City of Edinburg. The area is generally east of North Main Drain, north of South Main Drain, south of SH 107 (W. University Dr.) and west of BS 281 (S. Closner Blvd). The system drainage areas are approximately 323 and 464 acres, respectively. The drainage network consists of a single lateral ditch for each system basin with ditch lengths of 5900 (NM-111) and 8000 (NM-113) feet. The NM-111 and NM-113 system drainage area and ditch alignments are shown in **Figure 6-12**.

The NM-111 and NM-113 systems are impacted by the North Main Drain water surface elevation. The high North Main Drain water surface elevations reduce the drainage systems' efficiency to convey the study area runoff. As previously discussed, any improvements to the North Main Drain associated with the Raymondville Drain Flood Control Project will potentially be beneficial to these systems' areas by lowering the ditches' tailwater conditions.

Additionally, the NM-113 system area is affected by the water surface elevations within the South Main Drain. The South Main Drain serves as the receiving ditch for several storm sewer systems within the area. However, the area is lower than the high banks and the water surface elevations of the South Main Drain. This results in the areas adjacent to the South Main Drain to sheetflow north towards NM-113 and increase the runoff within the ditch.

The hydraulic analysis shows that the NM-111 system has greater than a 25-year capacity. The crossing structures are shown to provide adequate capacity to convey the existing and proposed flows. The hydraulic analysis shows that the NM-113 system has a 25-year capacity along the majority of the channel with some out-of-bank ponding due to low overbank areas and restrictive crossing structures. The hydraulic analysis shows that the culverts at Jackson Road and Sugar Road require improvement to provide sufficient capacity for existing and future conditions. Proposed culverts include an additional box at Jackson Road and a culvert replacement at Sugar Road. The existing and proposed structures for the NM-111 and NM-113 systems are listed in **Table 6-15**.

4086	SUGAR	18" RCP	102	42" RCP

The Edinburg ISD has identified flooding concerns with regards to the Freddy Gonzalez Elementary School located along the south bank of NM-113 at S. Sugar Road and the South Middle School, located at Freddy Gonzalez Dr. and S. 4th Ave. upstream of the NM-111 ditch.

In order to provide additional drainage relief for the South Middle School, the existing NM-111 ditch is proposed to be extended east (upstream) to the school. The ditch extension would include approximately 800 feet of ditch to Geoffrey Ln. with proposed culvert under Geoffrey Ln. and across S. 4th Ave. to connect to the school campus property.

Since the drainage area at the existing upstream end of NM-111 is restricted by the railroad and the existing culvert crossing, it is recommended that a detention basin be proposed to supplement any drainage improvements upstream of the railroad. The detention basin may be proposed at either east or west of the railroad adjacent to the NM-111 alignment, based on land availability and acquisition cost, as shown in **Figure 6-12**.

A residential flood occurrence was documented within the NM-113 drainage area at 914 Tori Ln during the September 2014 storm event. This location is identified in **Figure 6-13**. Based on the overland topography, the subdivision is shown to be a localized low-lying area. There is not an overland sheetflow path from this area due to the elevated canal to the south and east, Sugar Road to the west, and the railroad to the north. The storm sewer system that serves this area drains to NM-113 south of the elevation canal. Based on the hydraulic analysis of NM-113, the ditch has sufficient capacity to convey the 100-year storm event; however the tailwater within the ditch during 25-year and higher storm events will prevent the storm sewer within this low-lying area to have sufficient hydraulic head to convey the runoff.

Based on field observations, the existing NM-113 ditch has siltation and vegetation overgrowth. It is recommended that the existing ditch be desilted and cleared to increase the ditch capacity and lower the water surface elevation within the ditch. It is also recommended that the City provide additional storm sewer capacity within the area to increase the existing system conveyance.

Comparisons of the existing and proposed condition water surface elevations for the NM-111 and NM-113 ditches are provided in **Tables 6-16** and **6-17**, respectively.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

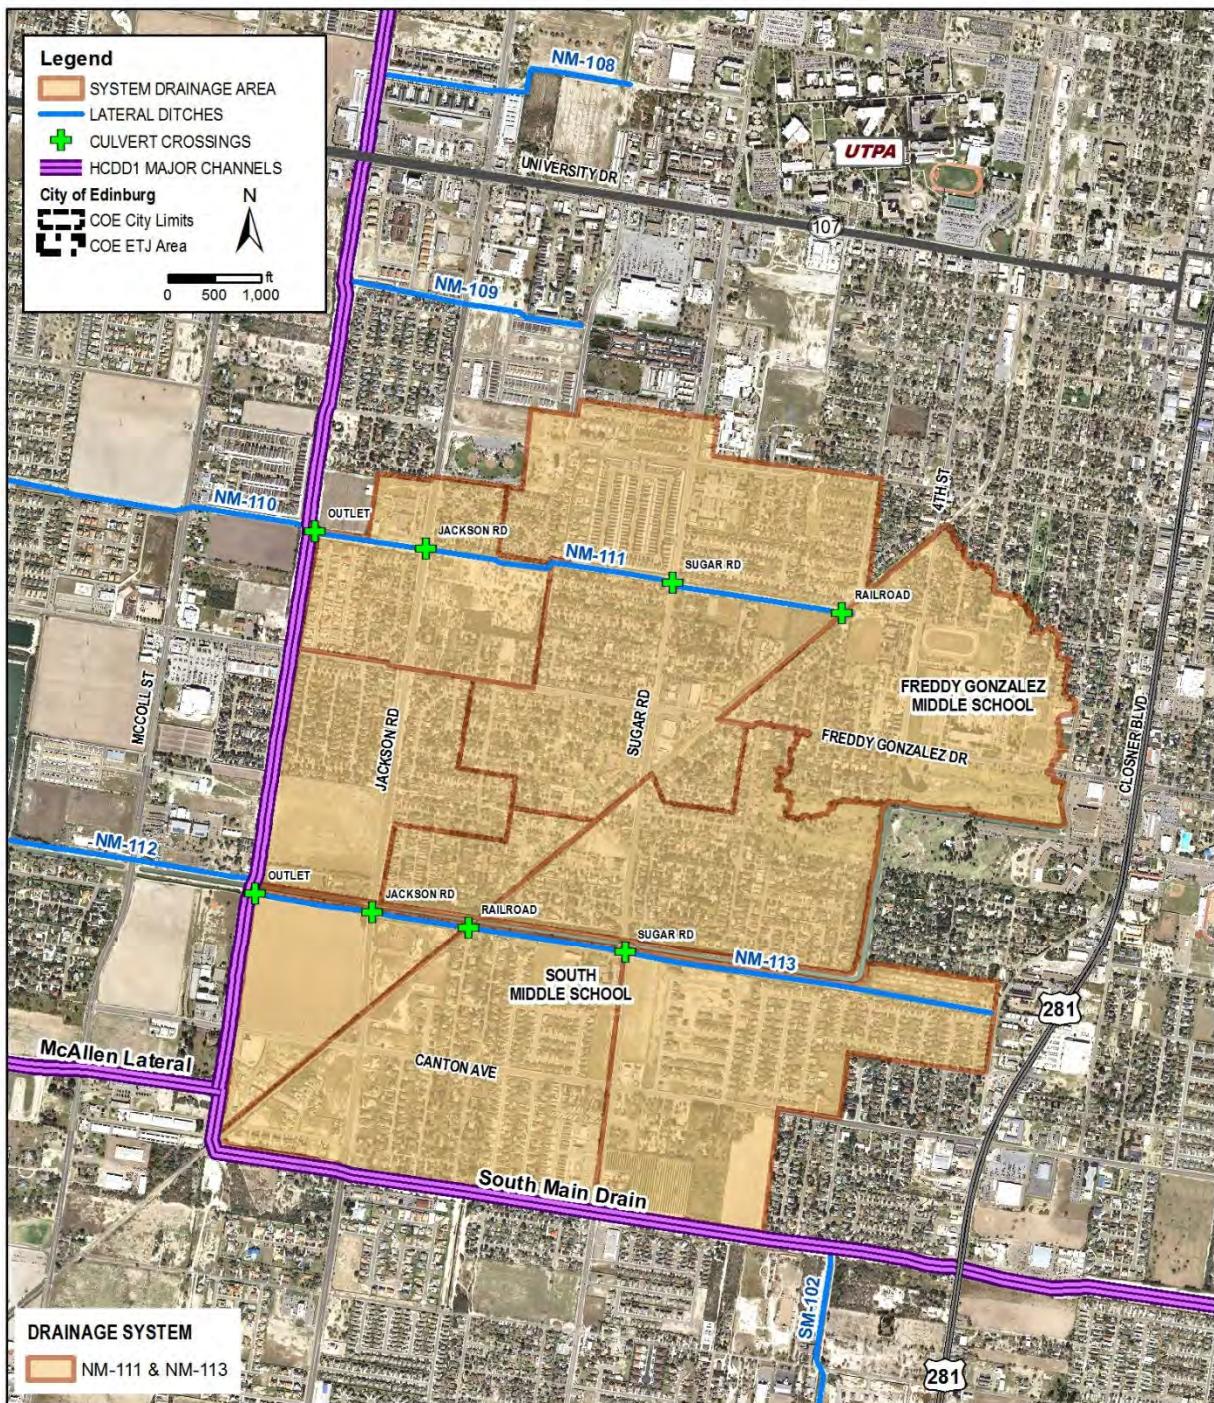

Figure 6-12. NM-111 & NM-113 Drainage Systems

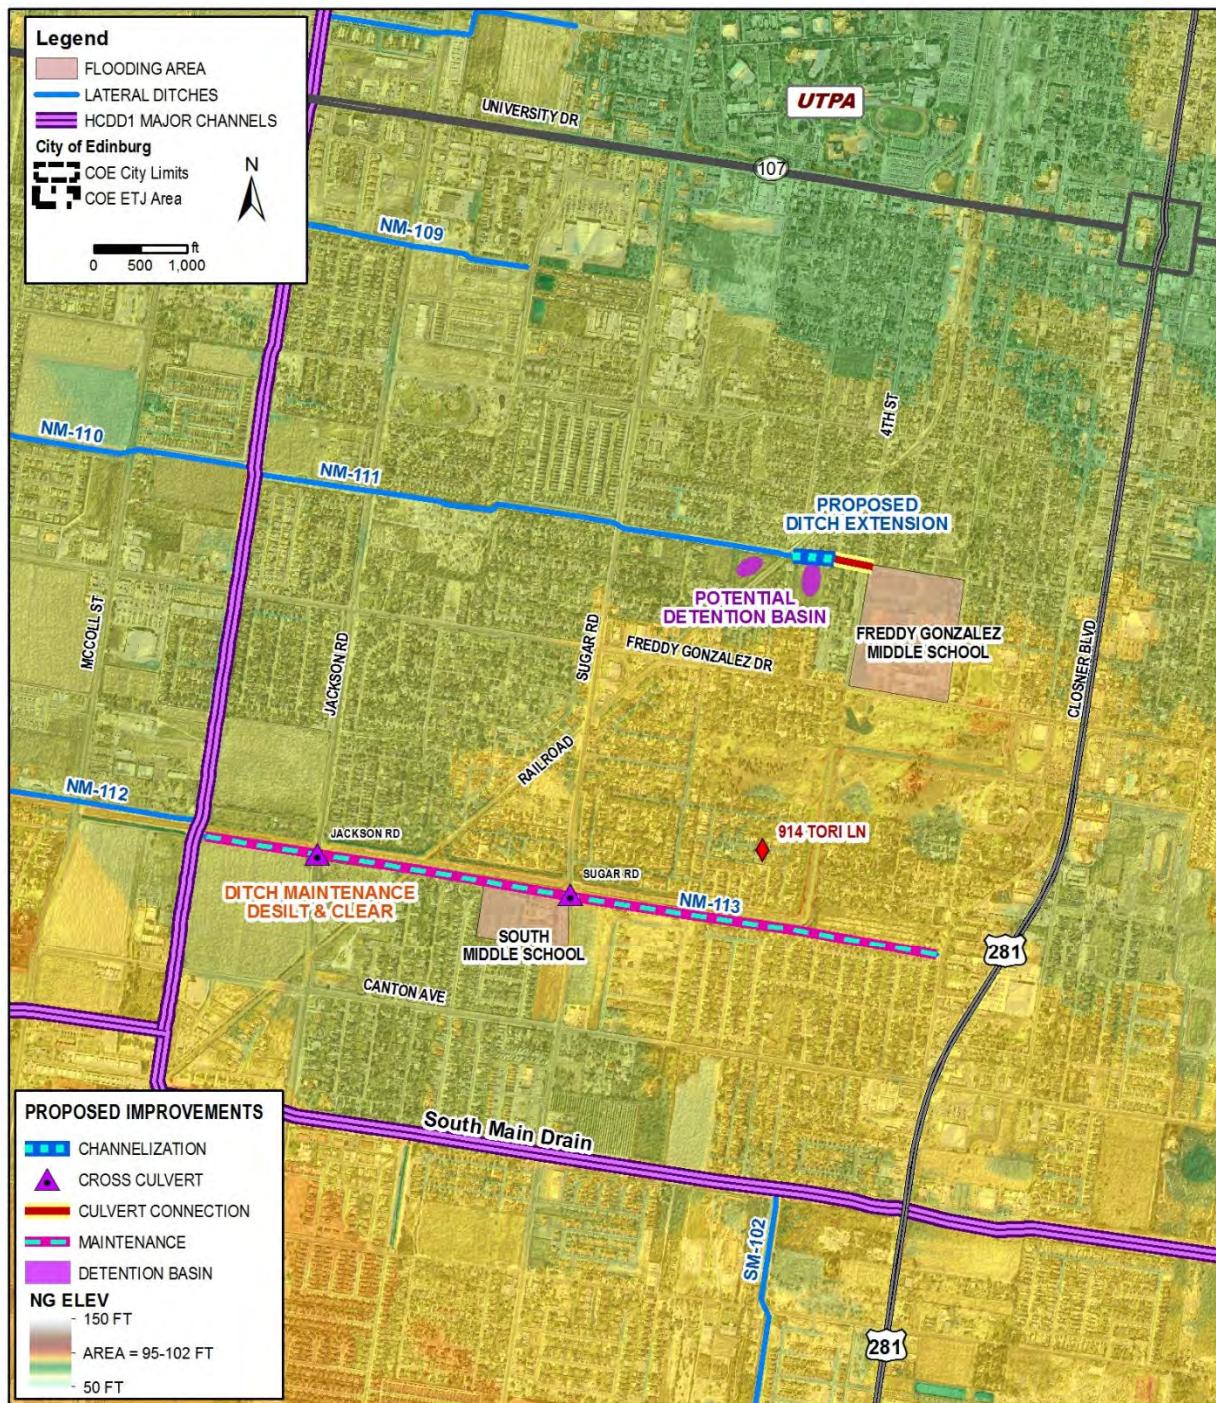

Figure 6-13. NM-111 & NM-113 Systems Improvements

SYSTEMS NM-115 & NM-116

Systems NM-115 and NM-116 represents the drainage area of lateral ditches to McAllen Lateral Drain located within the southwest portions of the City of Edinburg and its ETJ. The area is generally located east of FM 336 (N. 10th St.), west of Jackson Road, north of FM 495 (Pecan St.), and south of the McAllen Lateral. The system drainage areas are approximately 2365 and 303 acres, respectively. The drainage networks consist of a single lateral ditch with lengths of 15,600 feet (NM-115) and 4430 feet (NM-116). The systems drain from south to north into McAllen Lateral Drain. The NM-115 and NM-116 system drainage area and ditch alignments are shown in **Figure 6-14**.

The drainage areas are considered to be fully developed consisting of dense residential and commercial areas. The drainage areas slope from south to north towards the McAllen Lateral Drain. The railroad serves as the southern boundary of the NM-116 drainage area and as a subbasin divide for the NM-115 drainage area.

Both drainage ditches are affected by the McAllen Lateral Drain (a lateral of North Main Drain) backwater within the downstream reaches. The upstream reaches of the systems are not affected by the McAllen Lateral Drain tailwater; this was evaluated based on HEC-RAS modeling.

The hydraulic analysis shows that the NM-115 system has a 25-year capacity within the lower (northern) reaches and a 10-year capacity within the upper (southern) reaches. Based on the open channel (no-culvert) hydraulic analysis, the crossing structures along the channel provide cumulative losses along the channel that significantly reduces the system's capacity during extreme events. Several crossing improvements were proposed to provide adequate capacity to convey the existing and proposed 25-year and 100-year flows. These improvements typically involve the addition of a box culvert to the existing structure with a culvert replacement proposed at Violet Road. The hydraulic analysis shows that the NM-116 system has a 25-year capacity along the channel with the Wisconsin Street crossing providing significant conveyance restrictions. The culverts at Wisconsin Street are proposed for replacement to increase the capacity of the system. The existing and proposed structures for the NM-115 and NM-116 systems are listed in **Table 6-18**. The proposed culvert replacement locations are shown in **Figure 6-15**.

Based on the development within drainage area and the conveyance capacity of the system ditches, no channel improvements are recommended within the NM-115 and NM-116 systems; however, various culvert replacements are recommended as presented in the above table. Comparisons of the existing and proposed condition water surface elevations for the NM-115 and NM-116 ditches are provided in **Tables 6-19** and **6-20**, respectively.

MASTER DRAINAGE PLAN

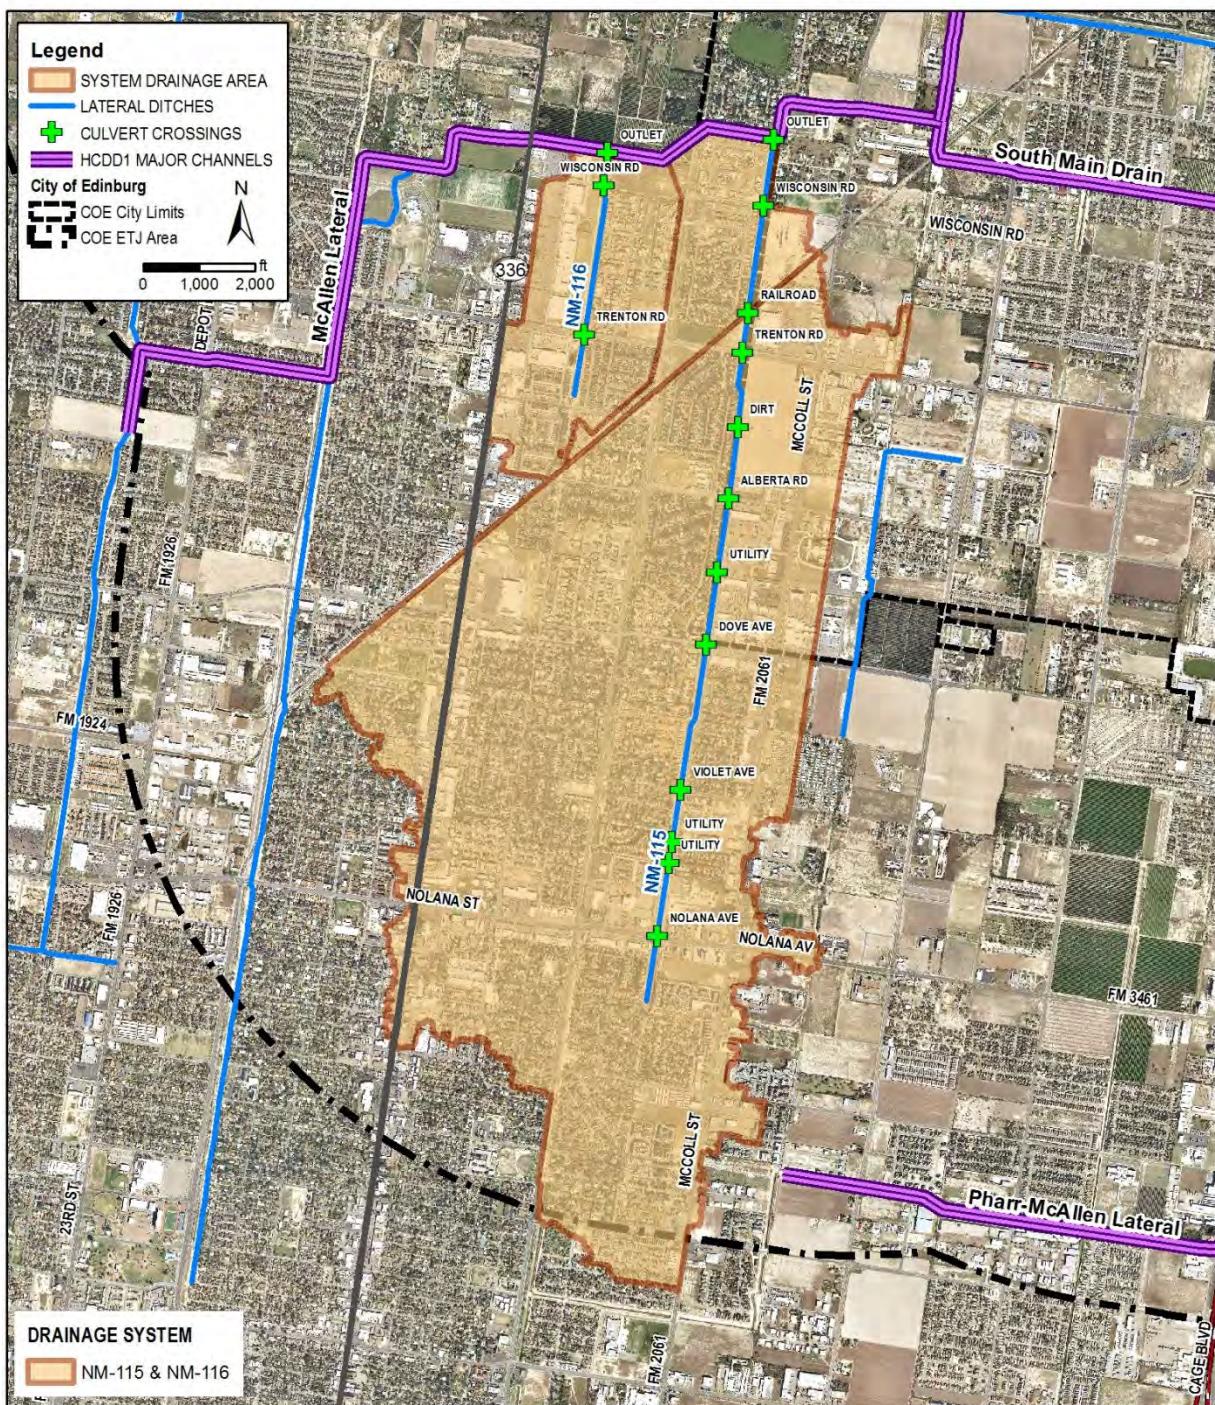

Figure 6-14. NM-115 & NM-116 Drainage Systems

CITY OF EDINBURG
MASTER DRAINAGE PLAN

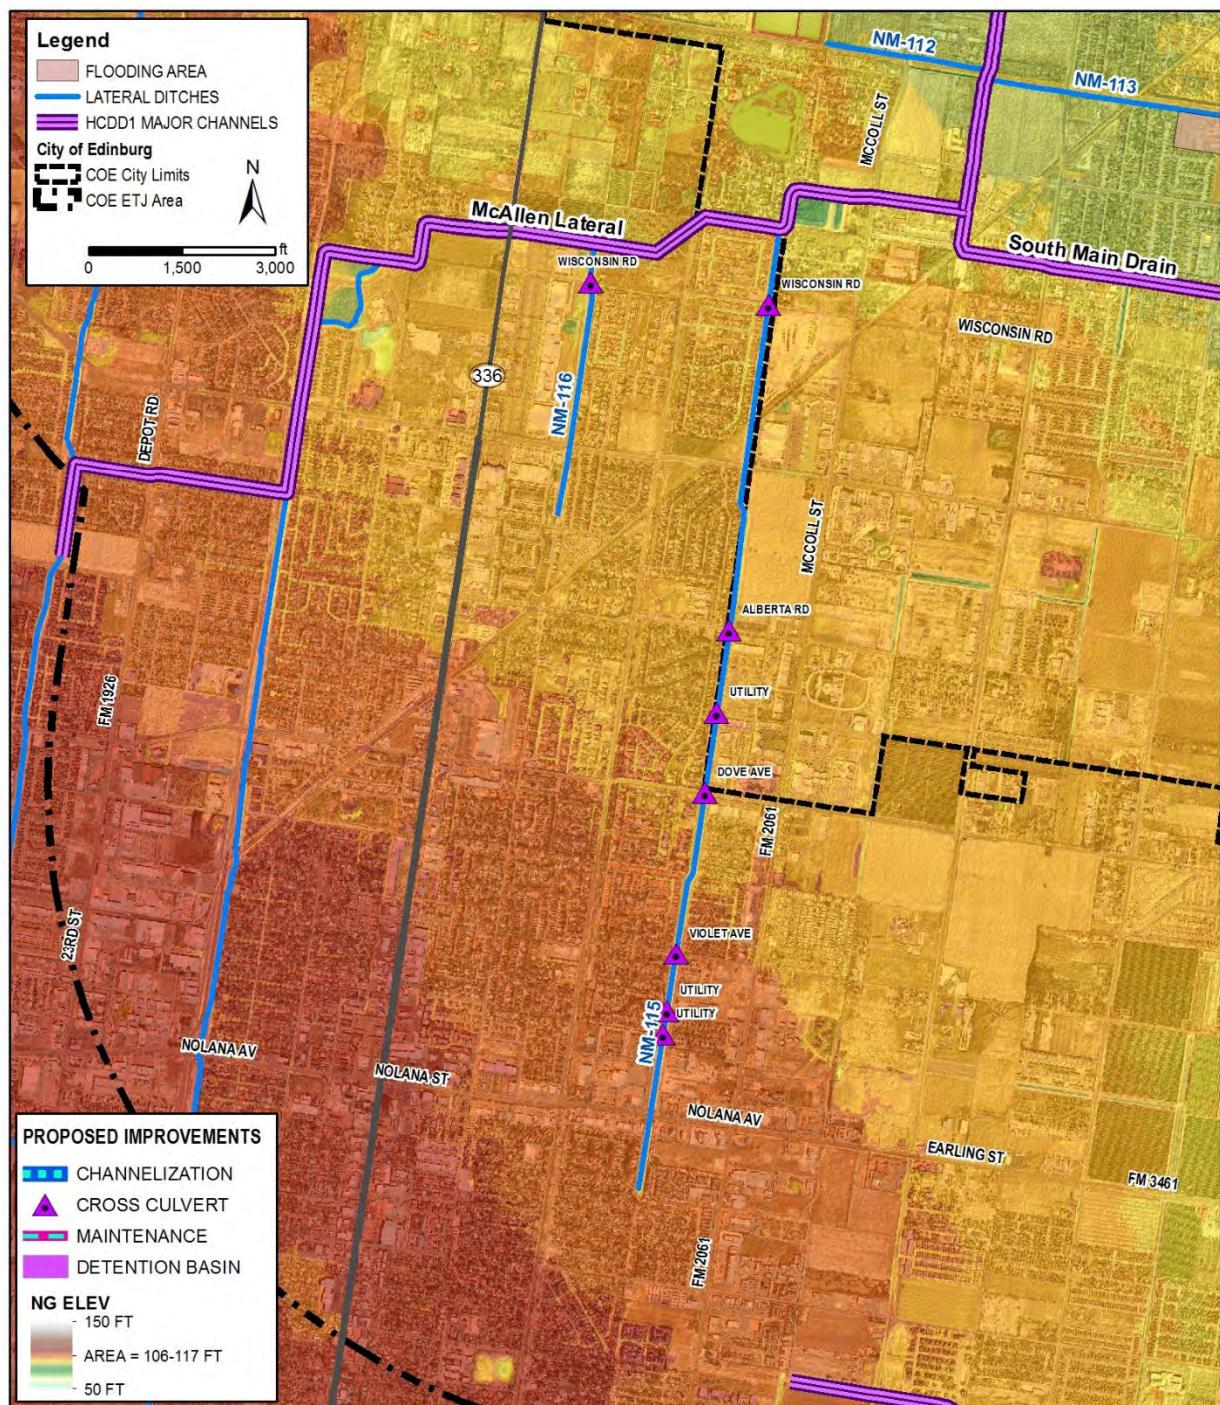

Figure 6-15. NM-115 & NM-116 Systems Topography

SYSTEMS ES-101 & ES-102

Systems ES-101 & ES-102 represents the contributing drainage areas of the lateral ditch to Edinburg Stub within the southeast portions of the City of Edinburg. The area is generally located west of BS 281 (Closner Blvd), south of Richardson Road, north of South Main Drain, and west of Raul Longoria Rd. The drainage systems receive runoff from the storm sewer systems that serve the east and southeast portions of the City central area. Based on the aerial, the system drainage area is considered to be fully developed, consisting of residential and commercial properties. The ES-101 & ES-102 system drainage areas and ditch alignments area shown in **Figure 6-16**.

The receiving ditches outfall into the Edinburg Stub, which is a tributary of the South Main Drain. Based on the topography of the Edinburg Stub shows that this ditch is extremely flat and is significantly impacted by the South Main Drain tailwater conditions.

The hydraulic analysis shows that the ES-100 system is dependent on the tailwater conditions of the receiving systems: Edinburg Stub for the COE ditches and South Main Drain for Edinburg Stub. Additionally, the low overbank areas adjacent to the ditches, especially Edinburg Stub, are susceptible to flooding and ponding even though the water surface elevations within the ditches are contained below the elevated channel banks.

The Edinburg Stub (ES-100) is a part of the HCDD1 MDP System; however, it serves as receiving drain for a large portion of the City of Edinburg eastside and downtown areas. Therefore, the ditch was considered within the hydraulic analysis of the ES-101 and ES-102 ditch systems and proposed drainage planning. Based on the hydraulic analysis, the Edinburg Stub has a 10 to 25-year capacity along its reach. However, the reach does experience out-of-bank ponding and flooding due to the low overbank areas and high channel banks. The hydraulic analysis shows that the culverts at Doolittle and Raul Longoria provide conveyance restrictions during larger storm events. In order to reduce the impacts of the Edinburg Stub tailwaters onto the upstream laterals, these two crossings are proposed for culvert replacement.

ES-101 ditch and the culvert structures are shown to have a greater than 25-year capacity without backwater effects from Edinburg Stub. With consideration of the backwater from Edinburg Stub, the ES-101 ditch system capacity is slightly reduced to a 25-year capacity.

ES-102 ditch and the culvert at Sprague Road shows to have sufficient capacity, without backwater effects from Edinburg Stub, for 25-year and greater storm events. Its lateral ES-102-01 has limited capacity, approximately 10-year, as a result of the existing culvert structures. With consideration of backwater effects from Edinburg Stub, the ES-102 ditch system capacity is reduced to a 25-year event with the ES-102-01 system capacity being reduced to less than a 10-

year event. The existing and proposed structures for the ES-100 system including the ES-101, ES-102, and ES-102-01 ditches are listed in **Table 6-21**.

Based on information provided by the City and residents within the ES-101 & ES-102 drainage system, this area has experienced frequent flooding. Locations of documented flooding are shown in **Figure 6-17**. The documented flooding is mostly within areas served by storm sewer systems, which outfall into the ES-101 and ES-102 ditches. Based on the overland topography, a significant portion of the drainage system area is located within the Edinburg Low.

The drainage system has several major constraints that limit the effectiveness of any single flood relief measure. These constraints include the flat topography, receiving HCDD1 tailwater conditions, US 281 Freeway Corridor, and limited available open land within the drainage area. The flat topography, in combination with the receiving ditches' tailwater conditions, reduce the available hydraulic head needed to convey the runoff within the drainage area. The US 281 Corridor restricts drainage improvement options from west to east due to construction cost. The

limited open land within the drainage area restricts locations for proposed detention and channel ROW within the flooding areas.

In order to provide an effective and efficient system within the drainage area, a combination of detention, channel improvements, and storm sewer trunkline is proposed. For the ES-102 system, which provides outfall for the east portions of the City central area, a detention basin is proposed to provide the existing storm sewer systems an efficient outfall and storm water runoff storage. The basin will lower the tailwater condition for the existing storm sewer systems serving the City central area. Additionally, the flow diversion to the basin and storage volume will reduce the burden on the receiving ditches, which in turn will lower the tailwater conditions for other storm sewer systems within the drainage system. In order to direct runoff from the City central area to the proposed detention basin, the outfall channels ES-102 and ES-102-01 will be improved and a collection storm sewer trunkline will need to be constructed to increase the conveyance from west of US 281 to the ES-102 ditch. A potential trunkline alignment could be along University Dr. or Spague St. across the US 281 corridor. The basin outlet is proposed along Doolittle Rd. south to the Edinburg Stub. In order to provide sufficient volume within the proposed basin, either the basin will require a pump outlet structure or channel improvements to Edinburg Stub and South Main Drain (to downstream of Alamo Dr.). The channel improvements would be required to lower the ditches invert and increase their conveyance capacity as well as provide for culvert replacements along ES-102-01 to handle the proposed flow diversion to the detention basin. The proposed improvements along ES-102 and ES-102-01 include an earthen channel with 30-foot bottom width, 3:1 side slopes, and a depth of approximately 10 feet. These improvements would also decrease the upstream tailwater conditions within the ES-101 & ES-102 drainage system. The proposed improvement reaches for ES-102 system are shown in **Figure 6-17**.

Field observations of the ES-101 ditch show that the ditch is overgrown and has standing water. It is recommended that this ditch be regularly maintained by desilting and clearing of vegetation overgrowth. Due to restricted ROW and the US 281 crossing, channel improvements to the ES-101 ditch are not recommended. In order to provide drainage relief for this drainage system, storm water detention basins are proposed. The basins will reduce the runoff into the receiving ditch and provide for a lower tailwater condition for the storm sewer systems. The basin outfall system is proposed to be connected to the ES-101 ditch as well as south into the South Main Drain upstream of US 281, providing additional relief within the ES-101 system. The proposed improvements for ES-101 system are shown in **Figure 6-17**.

Comparisons of the existing and proposed condition water surface elevations for the ES-100 system including ES-100, ES-101, and ES-102 and ES-102-01 ditches are provided in **Tables 6-22, 6-23 and 6-24**, respectively.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

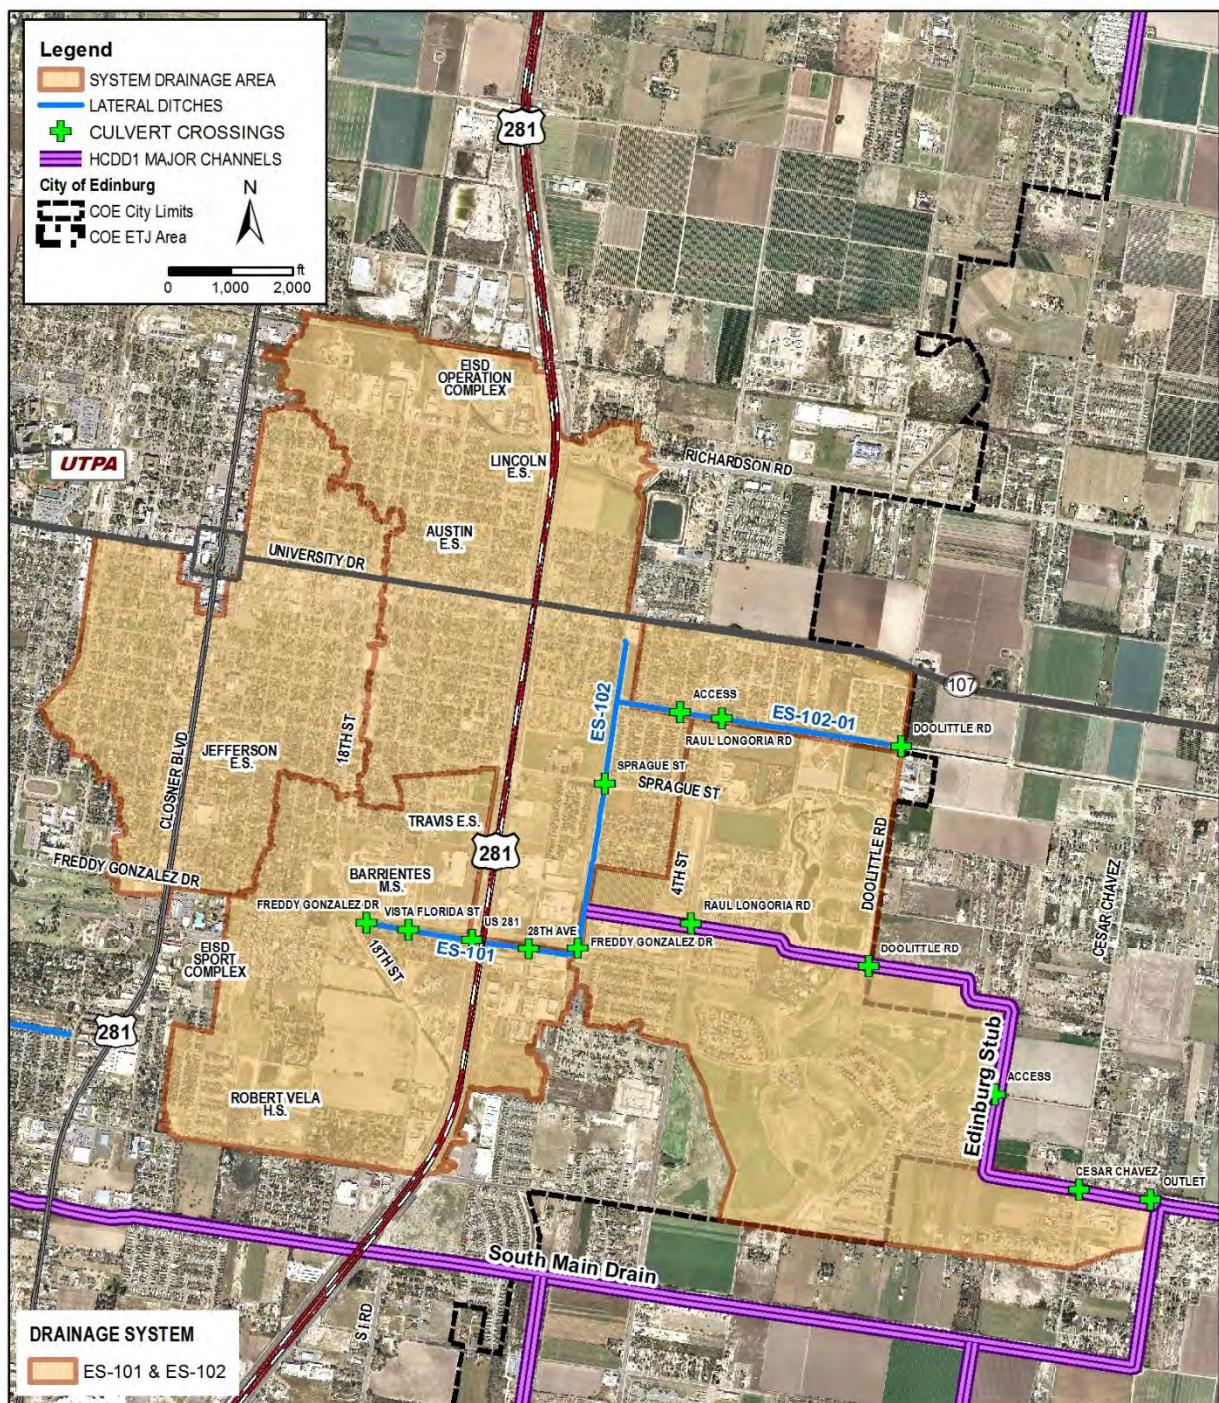

Figure 6-16. ES-101 & ES-102 Drainage Systems

CITY OF EDINBURG
MASTER DRAINAGE PLAN

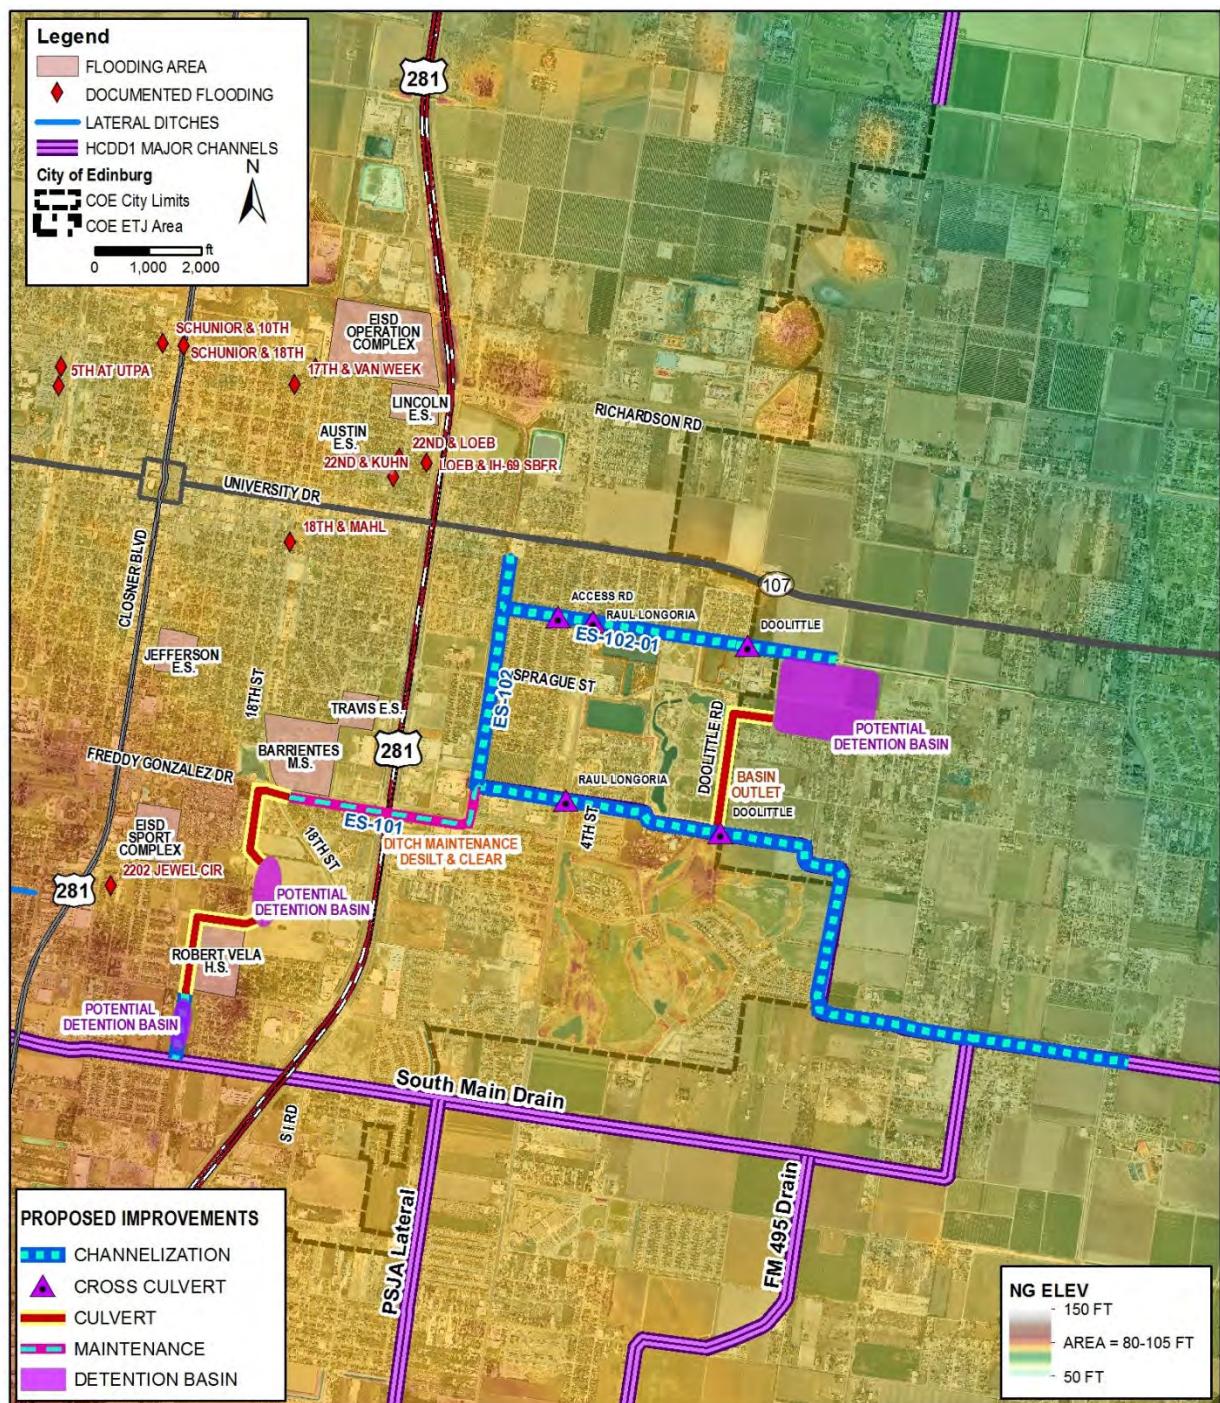

Figure 6-17. ES-101 & ES-102 Proposed System Improvements

SYSTEMS SM-101, SM-102, & SM-103

Systems SM-101, SM-102, and SM-103 represent the contributing drainage areas of a lateral ditch and storm sewer systems that outfall into South Main Drain within the southern portions of the City of Edinburg. The area is generally located east of the railroad and west of US 281 within the BS 281 (Closner Blvd.) reach of South Main Drain. See **Figure 6-18** for the drainage system areas.

The drainage system SM-101 includes storm sewer system collection areas that outfall directly into South Main Drain. The area is located south of South Main Drain, between Jackson Road and Sugar Road. The drainage system SM-102 includes the systems that are received a lateral ditch to South Main Drain. This area is located south of South Main Drain, mostly west of BS 281. The drainage system SM-103 includes the collection areas for storm sewer systems north of South Main Drain, upstream of US 281 (IH-69), specifically for the system along Closner Blvd. The area north of South Main Drain is considered to be mostly developed, consisting of commercial along Closner Blvd and dense residential areas. The area south of South Main Drain consist partially of residential areas.

The drainage system areas adjacent the South Main Drain are subjected to high water surface elevations within the channel, which influence the conveyance capability of the internal storm systems during 10-year and greater storm events. These systems included the SM-101 and SM-103 storm sewer systems and the SM-102 drainage ditch.

The hydraulic analysis of the SM-102, shows the ditch and cross-culverts have sufficient capacity for 25-year storm events. However as previously mentioned, the ditch is affected by the tailwater from South Main Drain, which results in flooding along the channel during 10-year and greater events. The existing and proposed structures for the SM-102 system are listed in **Table 6-25**. The existing water surface elevations for the SM-102 ditch are provided in **Table 6-26**.

TABLE 6-25. SM-102 SYSTEM CROSS-DRAINAGE STRUCTURE INVENTORY

DITCH STATION	CROSSING NAME	EXISTING STRUCTURE	CULVERT LENGTH	PROPOSED STRUCTURE
SM-102				
1319	WISCONSIN	48" RCP	220	--
3316	ACCESS	60" RCP	86	--

In order to provide drainage infrastructure for future development within the drainage system area, the SM-102 system is proposed to be extended south, as shown in **Figure 6-19**. The proposed ditch configuration should consist of a 10-foot bottom trapezoidal, earthen section with 3:1 (H:V) side slopes and an approximate deep of 8 feet.

The Edinburg ISD has identified a potential flooding concern for the sport complex and stadium located along Closner Blvd., south of Freddy Gonzalez Dr. Additionally, the City has provided a documented flooding location east of Closner Blvd., just south of the Edinburg ISD sport complex. Based on the topography, these areas are within a localized low-lying area. These identified locations are within the SM-103 area and are shown in **Figure 6-19**.

In order to provide protection and relief for these low-lying areas east of Closner Blvd, either a localized detention basin would be required or connection be provided to the proposed ES-101 detention basin as described in the previous section and shown in **Figure 6-19**.

CITY OF EDINBURG MASTER DRAINAGE PLAN

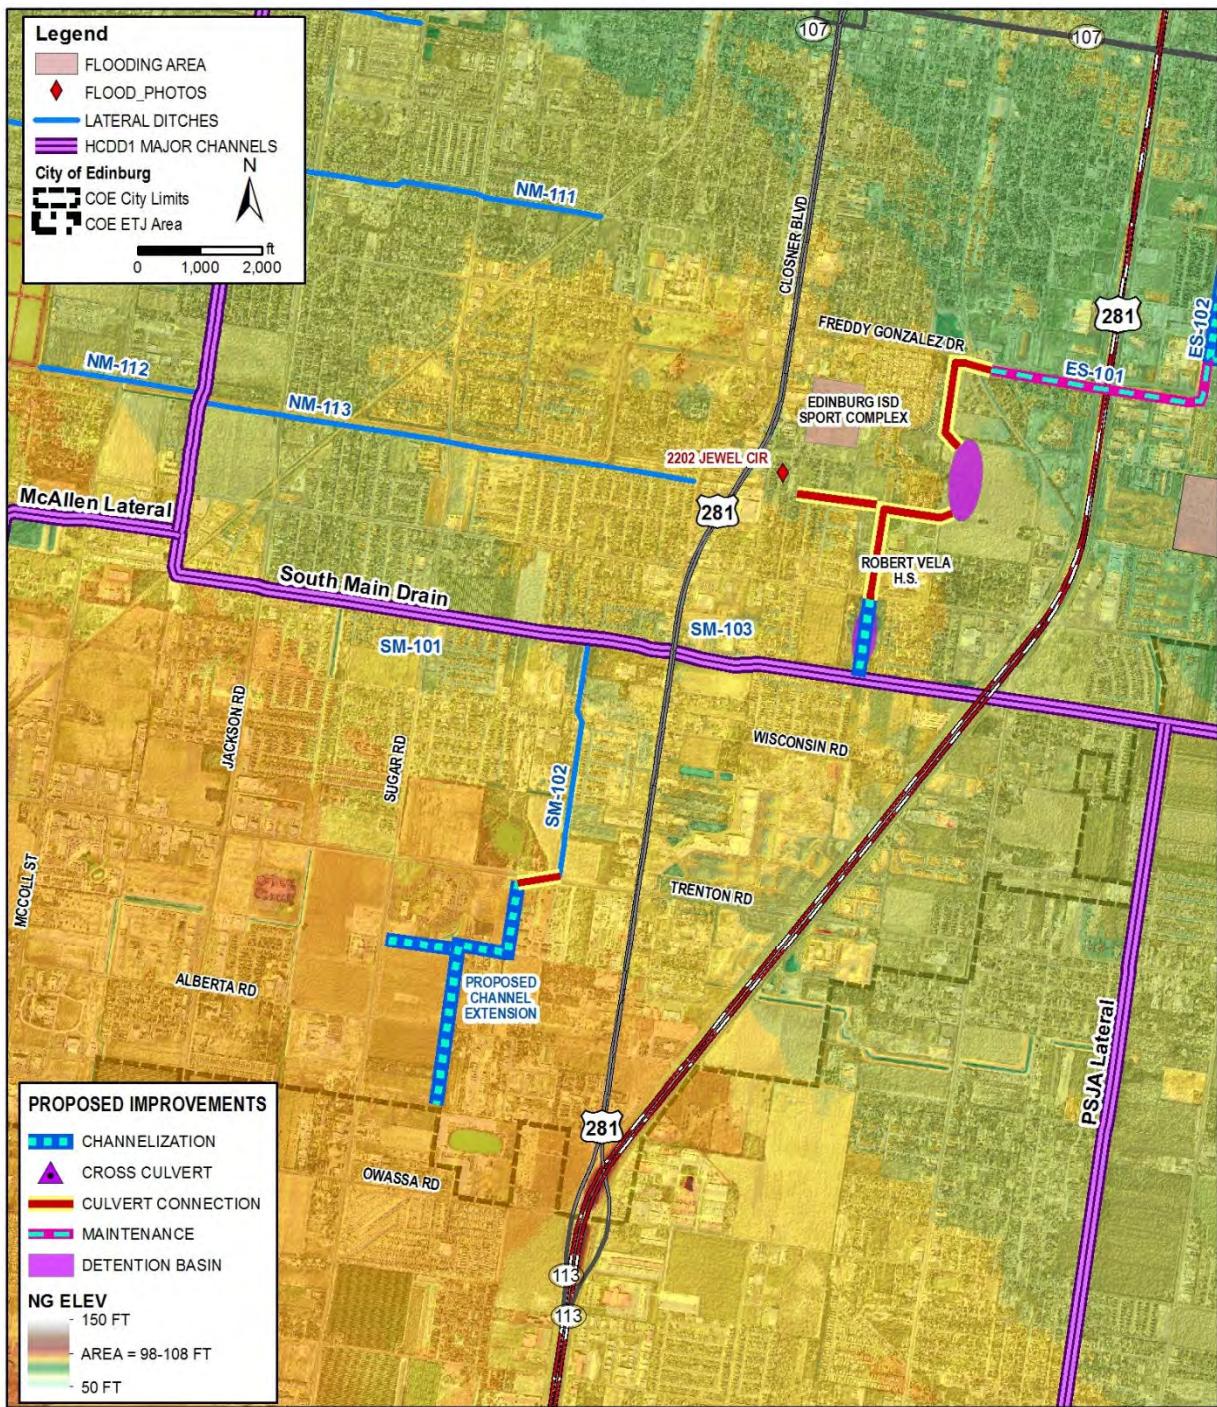

Figure 6-19. SM-101, SM-102, & SM-103 Proposed System Improvements

SYSTEM SM-104

System SM-104 represents a drainage area within the south-eastern portions of the City that drains via overland sheetflow and storm sewer to the South Main Drain. The area is generally located east of US 281 (IH-69), west of S. Raul Longoria Road, south of Los Lagos Drive, and north of South Main Drain. This area has been identified by the City through public meeting comments with having flooding issues. Based on the overland topography, the area is a natural depressed area located between US 281 and S. Raul Longoria Road. The identified location of flooding is within two subdivisions located within this depressed area. There is no outfall channel within this area or overland flow paths to provide an effective drainage outlet.

Based on the hydraulic analysis for South Main Drain, the computed 10-year water surface elevation at S. Raul Longoria Road is approximately 97.7 feet. This represents approximately 3 feet in ponding depth at the identified flooding subdivision. The South Main Drain high water surface elevation limits the conveyance of any drainage system outfalling into at this location.

The high water surface elevation within South Main Drain complicates a proposed solution to the drainage problems within the area. However, to provide positive relief to this area during frequent storm events, a drainage ditch system is recommended to convey the runoff for the existing development and adjacent future developable areas to South Main Drain. Based on the aerial photo, topography, and undeveloped areas, a proposed ditch system alignment is presented in **Figure 6-20**. This alignment is preliminary and will require land acquisition investigation prior to finalization of design alignment. The ditch configuration is based on a typical minimum ditch size of 10-foot bottom, 3:1 (H:V) side slopes, and an approximate depth of 8 feet.

An alternative proposed improvement is a detention basin that will provide outfall and runoff storage volume for the problematic areas until peak water surface elevations along the South Main Drain have receded.

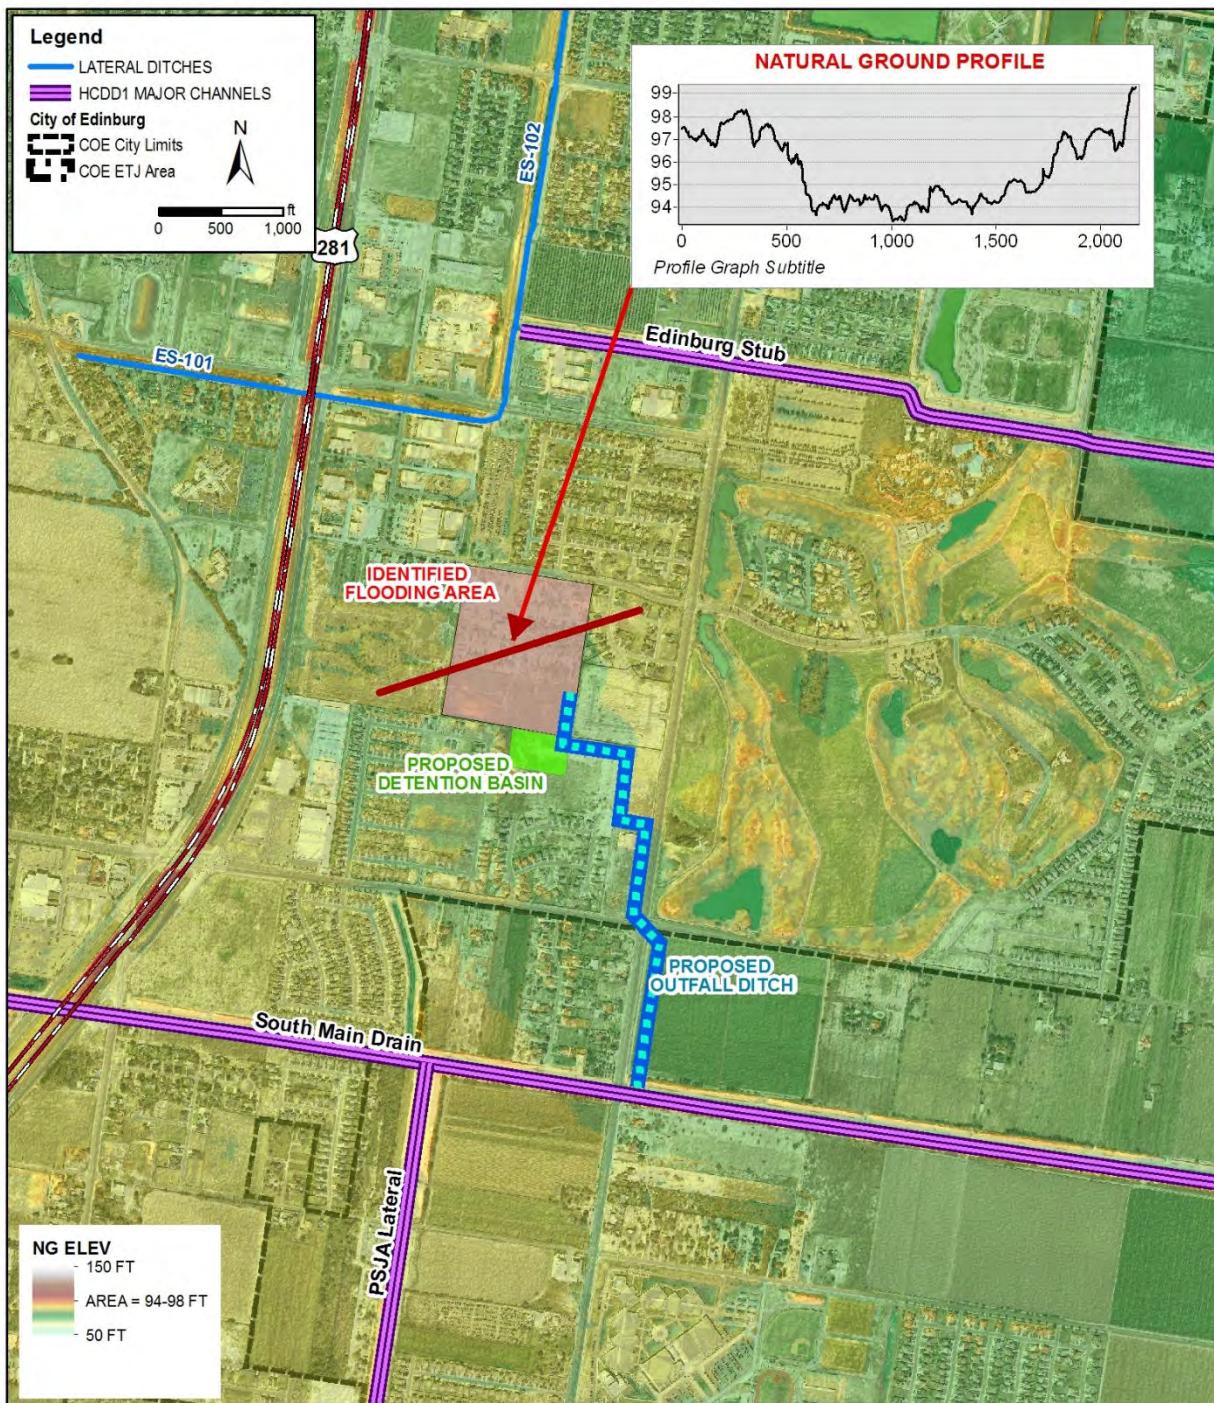

Figure 6-20. SM-104 Drainage System

SYSTEMS MC-100 & MC-101

Systems MC-100 & MC-101 represent the contributing drainage areas of a lateral ditch of Monte Cristo Drain and the contributing drainage area to the upstream end of Monte Cristo Drain within the north-east portions of the City of Edinburg. The area is generally located east of the railroad and west of US 281 within the BS 281 (Closner Blvd.) reach of South Main Drain. See **Figure 6-21** for the drainage system areas.

The lateral has been recently constructed from east of US 281 (IH-69) to its confluence into Monte Cristo Drain at Monte Cristo Road by the City of Edinburg in partnership with the U.S. Department of Housing and Urban Development as part of a Community Development Block Grant. The improvements included a new channel alignment to collect the system area runoff and convey it to the Monte Cristo Drain. The channel configuration consists of an earthen trapezoidal section, and the road cross-culverts were sized based on the channel reconstruction project. The upstream ditches to the MC-101 lateral ditch have been developed as part of a recent development located at the northeast corner of the US 281 and Monte Cristo Road intersection. The hydraulic analysis of the MC-101 system shows the ditch and cross-culverts have a greater than 25-year capacity. The existing and proposed structures for the MC-101 system are listed in **Table 6-27**.

TABLE 6-27. MC-101 SYSTEM CROSS-DRAINAGE STRUCTURE INVENTORY

DITCH STATION	CROSSING NAME	EXISTING STRUCTURE	CULVERT LENGTH	PROPOSED STRUCTURE

HCDD1 currently has proposed improvements planned for the Monte Cristo Drain (HCDD1 #J-09) main ditch system. The proposed improvements are designed for a 25-year storm event capacity. These improvements will provide increase conveyance capacity for the Monte Cristo Drain Watershed drainage systems.

The City has identified flooding concerns for the existing residential area along Doolittle Road, north of Monte Cristo Road. However the new drainage ditch along the MC-101 alignment

constructed by the City, intersects this area. This new drainage ditch should provide drainage relief to this flooding concern area.

The City has also identified flooding concerns south of Monte Cristo Road within subdivisions between Doolittle Road and M Road. Also included within this area are two Edinburg ISD campuses. In order to provide storm water relief for the existing and future development within this area, it is recommended that a drainage system be extended upstream from Monte Cristo Drain to serve this area. The system should include a combination of drainage ditch and storm trunkline to convey the runoff to Monte Cristo Drain. The proposed components are shown in **Figure 6-22**. The drainage ditch is proposed to run from Russell Road to north of Rogers Road, consisting of an earthen, trapezoidal section with 10-foot bottom width, 3:1 (H:V) side slopes, and an approximate depth of 8 feet.

The Edinburg ISD has identified flooding concerns for several campuses within the Monte Cristo Drain Watershed. The previously discussed MC-101 system construction and the proposed Monte Cristo Drain improvements will provide a higher level of flood protection for these locations. These areas are shown in **Figure 6-22**.

CITY OF EDINBURG
MASTER DRAINAGE PLAN

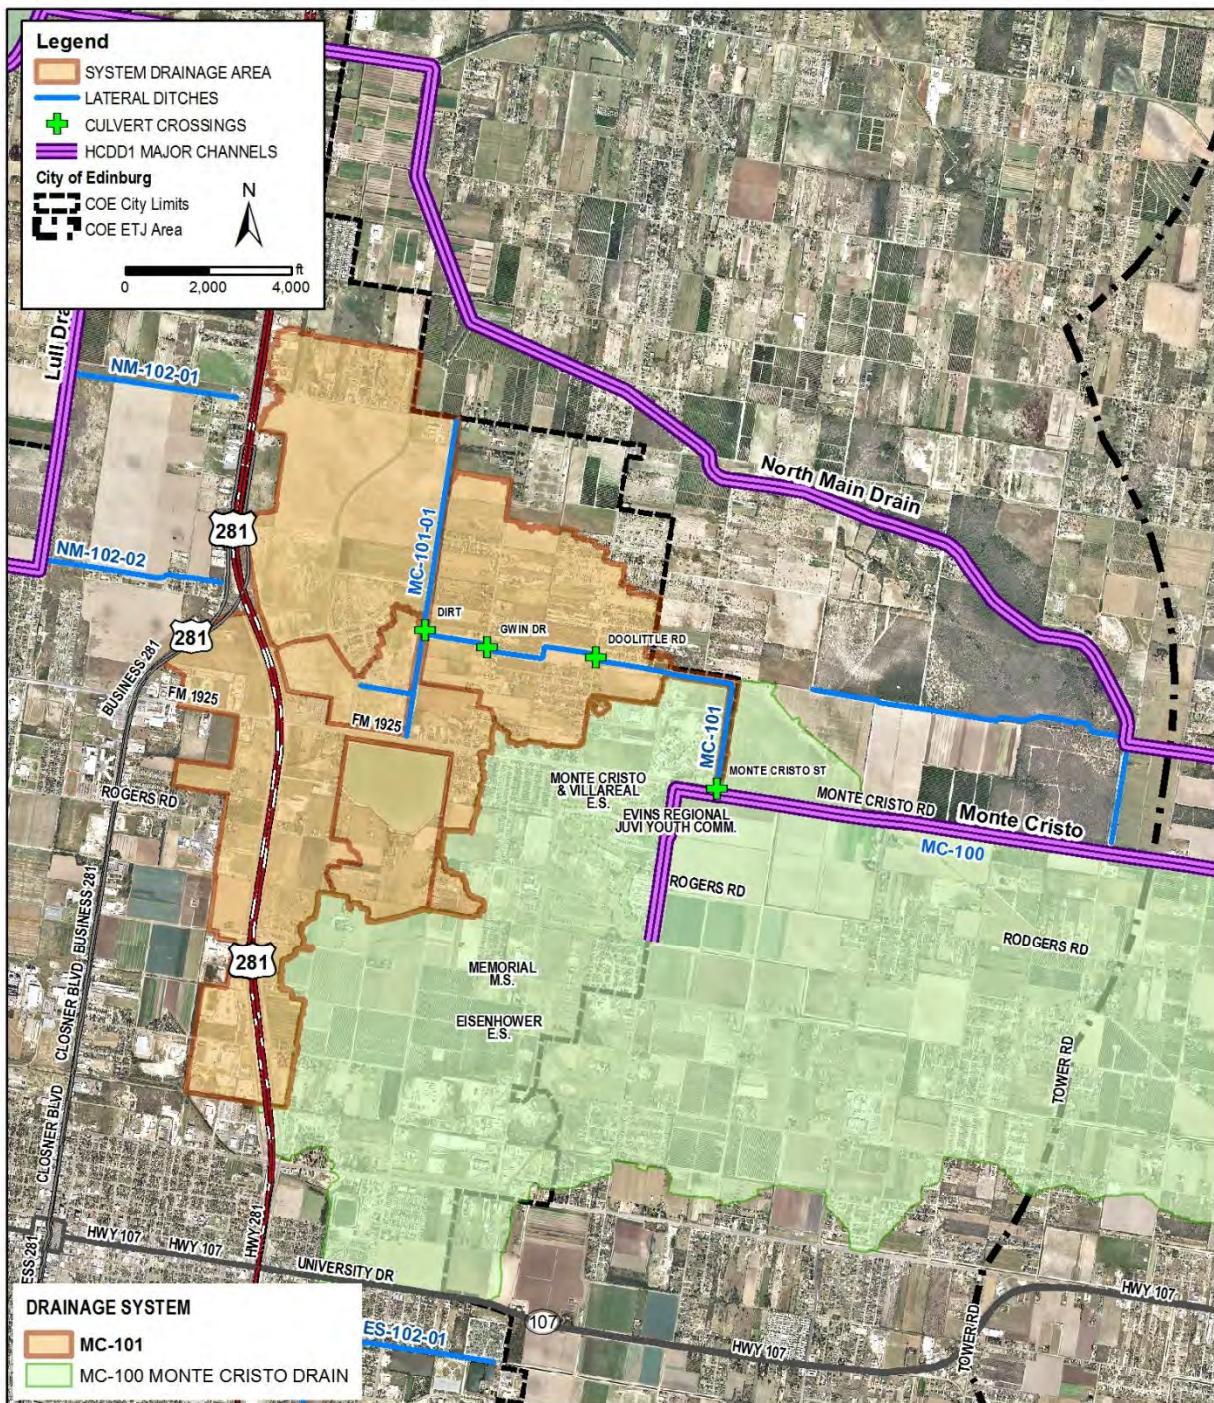

Figure 6-21. MC-100 & MC-101 Drainage Systems

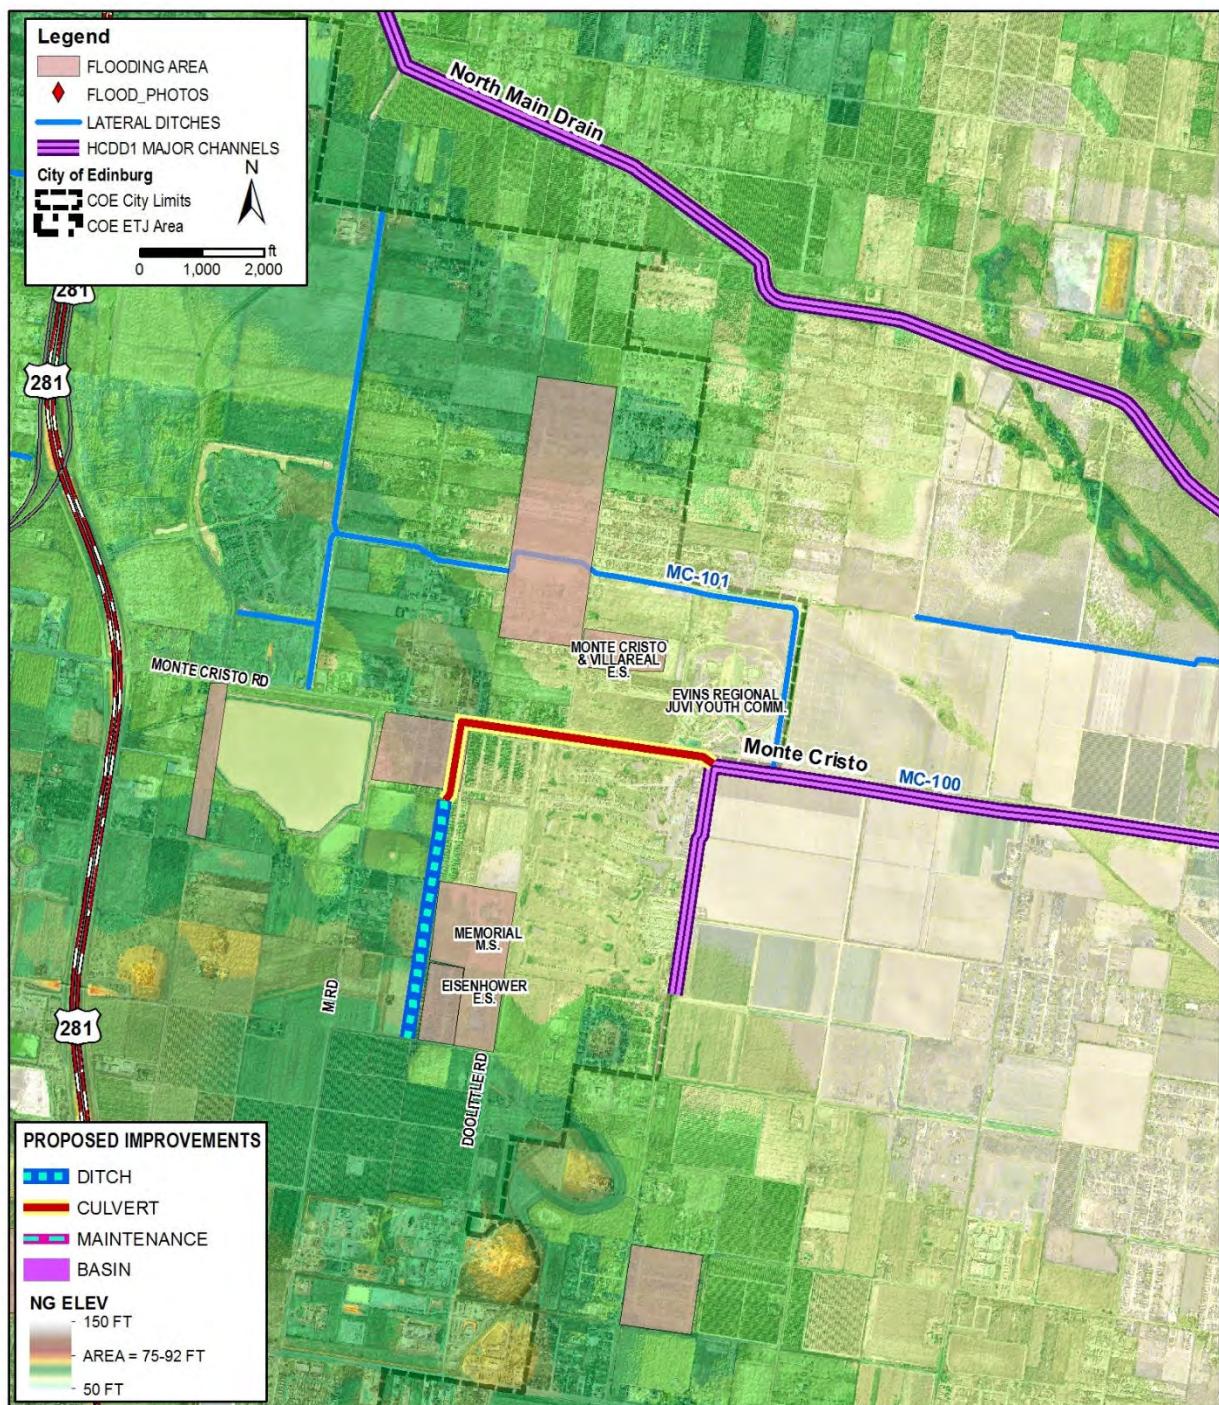

Figure 6-22. MC-100 & MC-101 Proposed System Improvements

7.0 PRIORITIZATION & COST SUMMARY

A master drainage plan presents potential projects for future implementation to reduce existing flooding and provide for future development drainage needs. To prioritize future projects and provide a plan for funding of those projects, a prioritization criteria should be adopted by the City. A set of prioritization criteria should be developed to select future drainage projects that provide a regional flood control benefit, contribute to the improvement of the community's well-being, support the development of the community, maintain the benefits of existing drainage systems, help protect natural habitat and landscapes, and provide multiple-use opportunities for flood control facilities. The prioritization criteria should generally consider basic criteria such as: historical flooding, public concerns & support, system inadequacy, downstream improvements independency, regional benefits, cost, and funding sources.

7.1 Prioritization

The master drainage plan presents a prioritization criteria for the proposed projects and provides potential plans for funding of those projects. However, a project's relative prioritization ranking can change based on a number of factors, such as lack of funding and other resources, reduction in priority, construction of adjacent projects, and lack of public support. The City should attempt to support and recommend flood control projects that, whenever possible, will provide a regional flood control benefit. In addition, the proposed projects should contribute to the improvement of the community's well-being, support the development of the community, maintain the benefits of existing drainage systems, help protect natural habitat and landscapes, and provide multiple-use opportunities for flood control facilities.

To assist in prioritizing of the potential projects, a ranking matrix was developed based on three criteria. Relative weight values are assigned for each criterion. The proposed projects were prioritized according to the recommended prioritization criteria ranking values. **Table 7-1** presents the prioritization criteria and respective relative weight values. Based on prioritization criteria, each proposed lateral system project priority weighted value was computed; these relative values are presented in **Table 7-2**.

TABLE 7-1. PROJECT PRIORITIZATION CRITERIA

CRITERION	CRITERION DESCRIPTIONS	RELATIVE WEIGHT VALUE
1	Is the system hydraulically inadequate?	2
2	Have there been any flooding complaints?	3
3	Are project benefits independent of downstream improvements?	1

7.2 Proposed Project Cost Estimates

The cost for the proposed improvements for the lateral drainage systems were estimated based on unit cost rates and quantity estimations of proposed improvement elements. Probable construction costs associated with the proposed improvements were estimated based on project bid unit cost information obtained from Texas Department of Transportation Department (TxDOT). The unit costs obtained include such items as: channel and detention excavation, culvert pipes and boxes, culvert end treatments, concrete paving, and etc. The itemized unit cost is provided within **Appendix E**.

The proposed improvement elements, as presented within Section 6, were detailed and quantified to estimate proposed project cost. A summary of cost for the lateral system proposed recommended plans are presented in **Table 7-3**. The detailed estimated cost for lateral systems

proposed improvements, recommended and any optional alternative, are presented within **Appendix E**.

TABLE 7-3. LATERAL SYSTEMS COST ESTIMATE SUMMARY

LATERAL SYSTEM	RECOMMENDED ALT. COST
NM-102	\$2,252,940
NM-103	\$714,690
NM-104	\$192,800
NM-105	\$316,053
NM-106	\$252,623
NM-108	\$631,950
NM-109	\$883,893
NM-110	\$452,263
NM-111	\$258,228
NM-112	\$0
NM-113	\$143,313
NM-115	\$596,720
NM-116	\$134,467
ES-102	\$8,820,196
ES-101	\$3,324,410
SM-102	\$880,927
SM-103	\$440,020
SM-104	\$913,504
MC-100	\$1,742,893
MC-101	\$0

The unit costs do not include any cost allowance for utility relocations, additional pavement replacement beyond the alignment of the proposed system, miscellaneous cost associated with construction, seeding/sod establishment, or acquisition of additional rights-of-way; therefore a 25-percent contingency of the proposed project subtotal cost should be considered to account for the aforementioned expenditures. The master drainage plan total cost and contingency is provided in **Table 7-4**.

TABLE 7-4. LATERAL SYSTEMS COST ESTIMATE SUMMARY

SUBTOTAL	\$22,951,890
25% CONTINGENCY	\$5,737,972
COE MDP TOTAL	\$28,689,862

7.3 Benefit-Cost Analysis

A benefit-cost analysis was performed for each individual drainage system and the entire project using FEMA Benefit-Cost Analysis (BCA) Tool (v5.0). The BCR values for the project systems ranged from 0.58 to 8.10 with a resulting overall Benefit-Cost Ratio (BCR) for the entire Master Drainage Plan project computed as 2.99. The economic benefits are defined as the expected flood loss reduction due to the flood water surface elevation reduction from the proposed drainage improvements based on 10-, 50-, 100-, and 500-year storm events. The U.S. Army Corps of Engineers' generic depth-damage curves were utilized for this analysis. Since this project is in the planning stage, representative structures were used in the model with the cost per square foot applied to the total number of structures multiplied by the average structure square footage. The BCA results for each drainage system are summarized in **Table 7-5**. A detailed BCA model report is provided in **Appendix F**.

TABLE 7-5. BENEFIT COST ANALYSIS SUMMARY

LATERAL SYSTEM	PROJECT BENEFITS	PROJECT COSTS	BCR
ES-100	\$ 37,235,543	\$ 12,144,606	3.07
NM-102	\$ 2,587,637	\$ 2,252,940	1.15

NM-116	\$ 538,217	\$ 134,467	4.00

8.0 CONCLUSION & SUMMARY

A Master Drainage Plan (MDP) was prepared to provide the City of Edinburg a planning tool to guide and prioritize future capital expenditures for the City's drainage systems within its boundaries and ETJ. Many of the City's drainage outfall systems are in need of improvements to alleviate flooding that have historically occurred throughout the City and to meet drainage needs of future development.

The Master Drainage Plan was developed to define various projects consisting of channel improvements, hydraulic structure improvements, and detention. The master drainage plan was developed to establish conceptual designs only, and does not include sufficient details for final design or construction. A total of twenty-one (21) City drainage systems were studied with detailed modeling analyses. Detailed hydrologic and hydraulic analyses were performed to identify drainage system inadequacies and develop drainage improvement opportunities required to alleviate existing flooding problems and upgrade the existing systems to provide drainage infrastructure needs for existing and future development.

The City of Edinburg central area is located within the low-lying topographic area that is a natural flow path, identified as the "Edinburg Low", between the North Main Drain and South Main Drain Watersheds. The natural topography and limited grade relief complicates the planning and development of an effective and efficient drainage improvement plan. Additionally, the efficiency of the existing and proposed drainage systems is dependent on the HCDD1 Master Drainage System tailwater conditions. In order to maximize the benefit of potential improvements to the City's drainage system, coordination between the City and HCDD1 is recommended. Additionally, HCDD1 has current discharge requirements that should be considered within any improvement project. It is recommended for the City to adopt a "no-adverse impact" policy to prevent project induced flooding to adjacent properties.

8.1 Stormwater Management

It has been generally recognized by local communities for the need of a "no adverse impact" drainage policy. The no-adverse impact policy requires that the action of the property owner or community does not adversely affect the flood risks of other properties or communities. These impacts are measured as increased runoff volume, increased flow rates, increased flood stages, increased flood velocity, or increased erosion and sedimentation. With the no-adverse impact policy, the land owner is responsible for mitigating the impacts by either physical measures or as provided for in a community or regional watershed based plan. The no-adverse impact is currently adopted by many communities and agencies, such as the City of Houston, City of San Antonio, and Texas Department of Transportation. All developments inside or outside of the

floodplain require drainage impact analysis and mitigation of potential adverse hydrologic/hydraulic impacts. Mitigations measures include channel control structures, detention basins, oversize underground storm sewer systems, and modification of human occupancy of floodplain (a nonstructural measure). To minimize future flood damages within the city limits, it is recommended that the City adopt and enforce a “no adverse impact” policy through its permit procedures.

8.2 Financing Alternatives

Financing alternatives should be investigated by the City for the proposed drainage improvements. Below are potential alternative sources for funding of the proposed drainage projects, including grants or fees from external and local funding sources.

8.2.1 Federal or State Grants

The Flood Mitigation Assistance (FMA) Program is a federal grant program administered by the Texas Water Development Board (TWDB), under an Agreement with the Federal Emergency Management Agency (FEMA). This program provides federal funding to assist States and communities in implementing measures to reduce or eliminate the long-term risk of flood damage to buildings, manufactured homes, and other structures insurable under the National Flood Insurance Program (NFIP). The FMA program was created as part of the National Flood Insurance Reform Act of 1994 (42 U.S.C. 4101) with the goal of reducing or eliminating claims under the NFIP. The FMA is a pre-disaster grant program. There are two types of work that can be funded: Planning Grants and Project Grants. The proposed drainage improvements would need to meet the specific grant standards to be eligible.

The Federal Emergency Management Agency (FEMA), through the Texas Division of Emergency Management, has provided substantial federal funding for the purchase of flooded homes through FEMA's Pre-Disaster Mitigation (PDM) program and Hazard Mitigation Grant Program (HMGP). Federal funding for home buyout usually requires local matching funds of at least 25%. It is important to note that, although some grant funds are made available only after a disaster declaration, these buyout grants do not provide immediate flood recovery assistance. These programs typically take eight to twelve months after the flood event to even get started, and then may take place over a period of many years following a flood event.

8.2.2 Local Funding Sources

The primary source of funds for any identified drainage projects is local. The following is a list of potential local funding sources.

GENERAL FUND

General fund is the primary source of funds for capital improvement projects within the City and is typically generated by tax revenues and other income to the City. A shortcoming for this type of funding is that all City departments are in need of these funds and drainage issues tend to be overlooked during dry periods due to the high cost and often long time frame to achieve a final resolution to the problem.

IMPACT FEES

Impact fee regulations are described in Chapter 395 of the local government code which authorizes cities and drainage districts, organized under Article III, Section 52 or Article XVI, Section 59 of the Texas Constitution, to impose an impact fee to cover the cost of improvements that are necessitated by new development. The act requires that the entity have in place a Capital Improvement Plan and is relatively stringent in its application. Upon a completion of a City Drainage CIP, impact fees would be a viable method for the City within its city limits to provide funding support for potential projects.

UTILITY FEES

Local storm water projects can be funded by the assessment of a drainage utility fee for potential projects based upon the amount of impervious cover, living units or site area.

GENERAL OBLIGATION BONDS

This is a bond issued by a municipality or a drainage district which is repaid by Ad Valorem taxes collected by the issuing entity rather than by revenues generated by the project funded by the bonds. This is a proper mechanism to use in order to fund capital improvement projects and can be used to fund improvements on which some of the cost can be recaptured by the mechanisms noted above.

REVENUE BONDS

This is a bond which is retired through revenue derived from the income generated by a facility constructed by the bond proceeds. Typically, water and sewer improvements are often financed by revenue bonds and paid for by the water and sewer sales income. Since revenue bonds are not supported by Ad Valorem taxes, it does not count against the issuing entity's mandated bond limit. Since storm runoff is not metered or charged for, hence no revenue income, this is seldom used for drainage improvements, although it has been used in limited cases by utility districts.

SPECIAL ASSESSMENT BONDS

Special Assessment Bonds are used to fund development projects within a specified area and is paid for through property tax assessments or special assessments on properties located within the defined area. This is often used for special road assessments but can be used for drainage.

TAX INCREMENT BONDS

Tax Increment Bonds are bond which are paid by the increase in value of properties located within a defined district or area which results from the capital improvements constructed within the area paid for by the bonds.

TWDB LOAN FINANCING ASSISTANCE PROGRAM

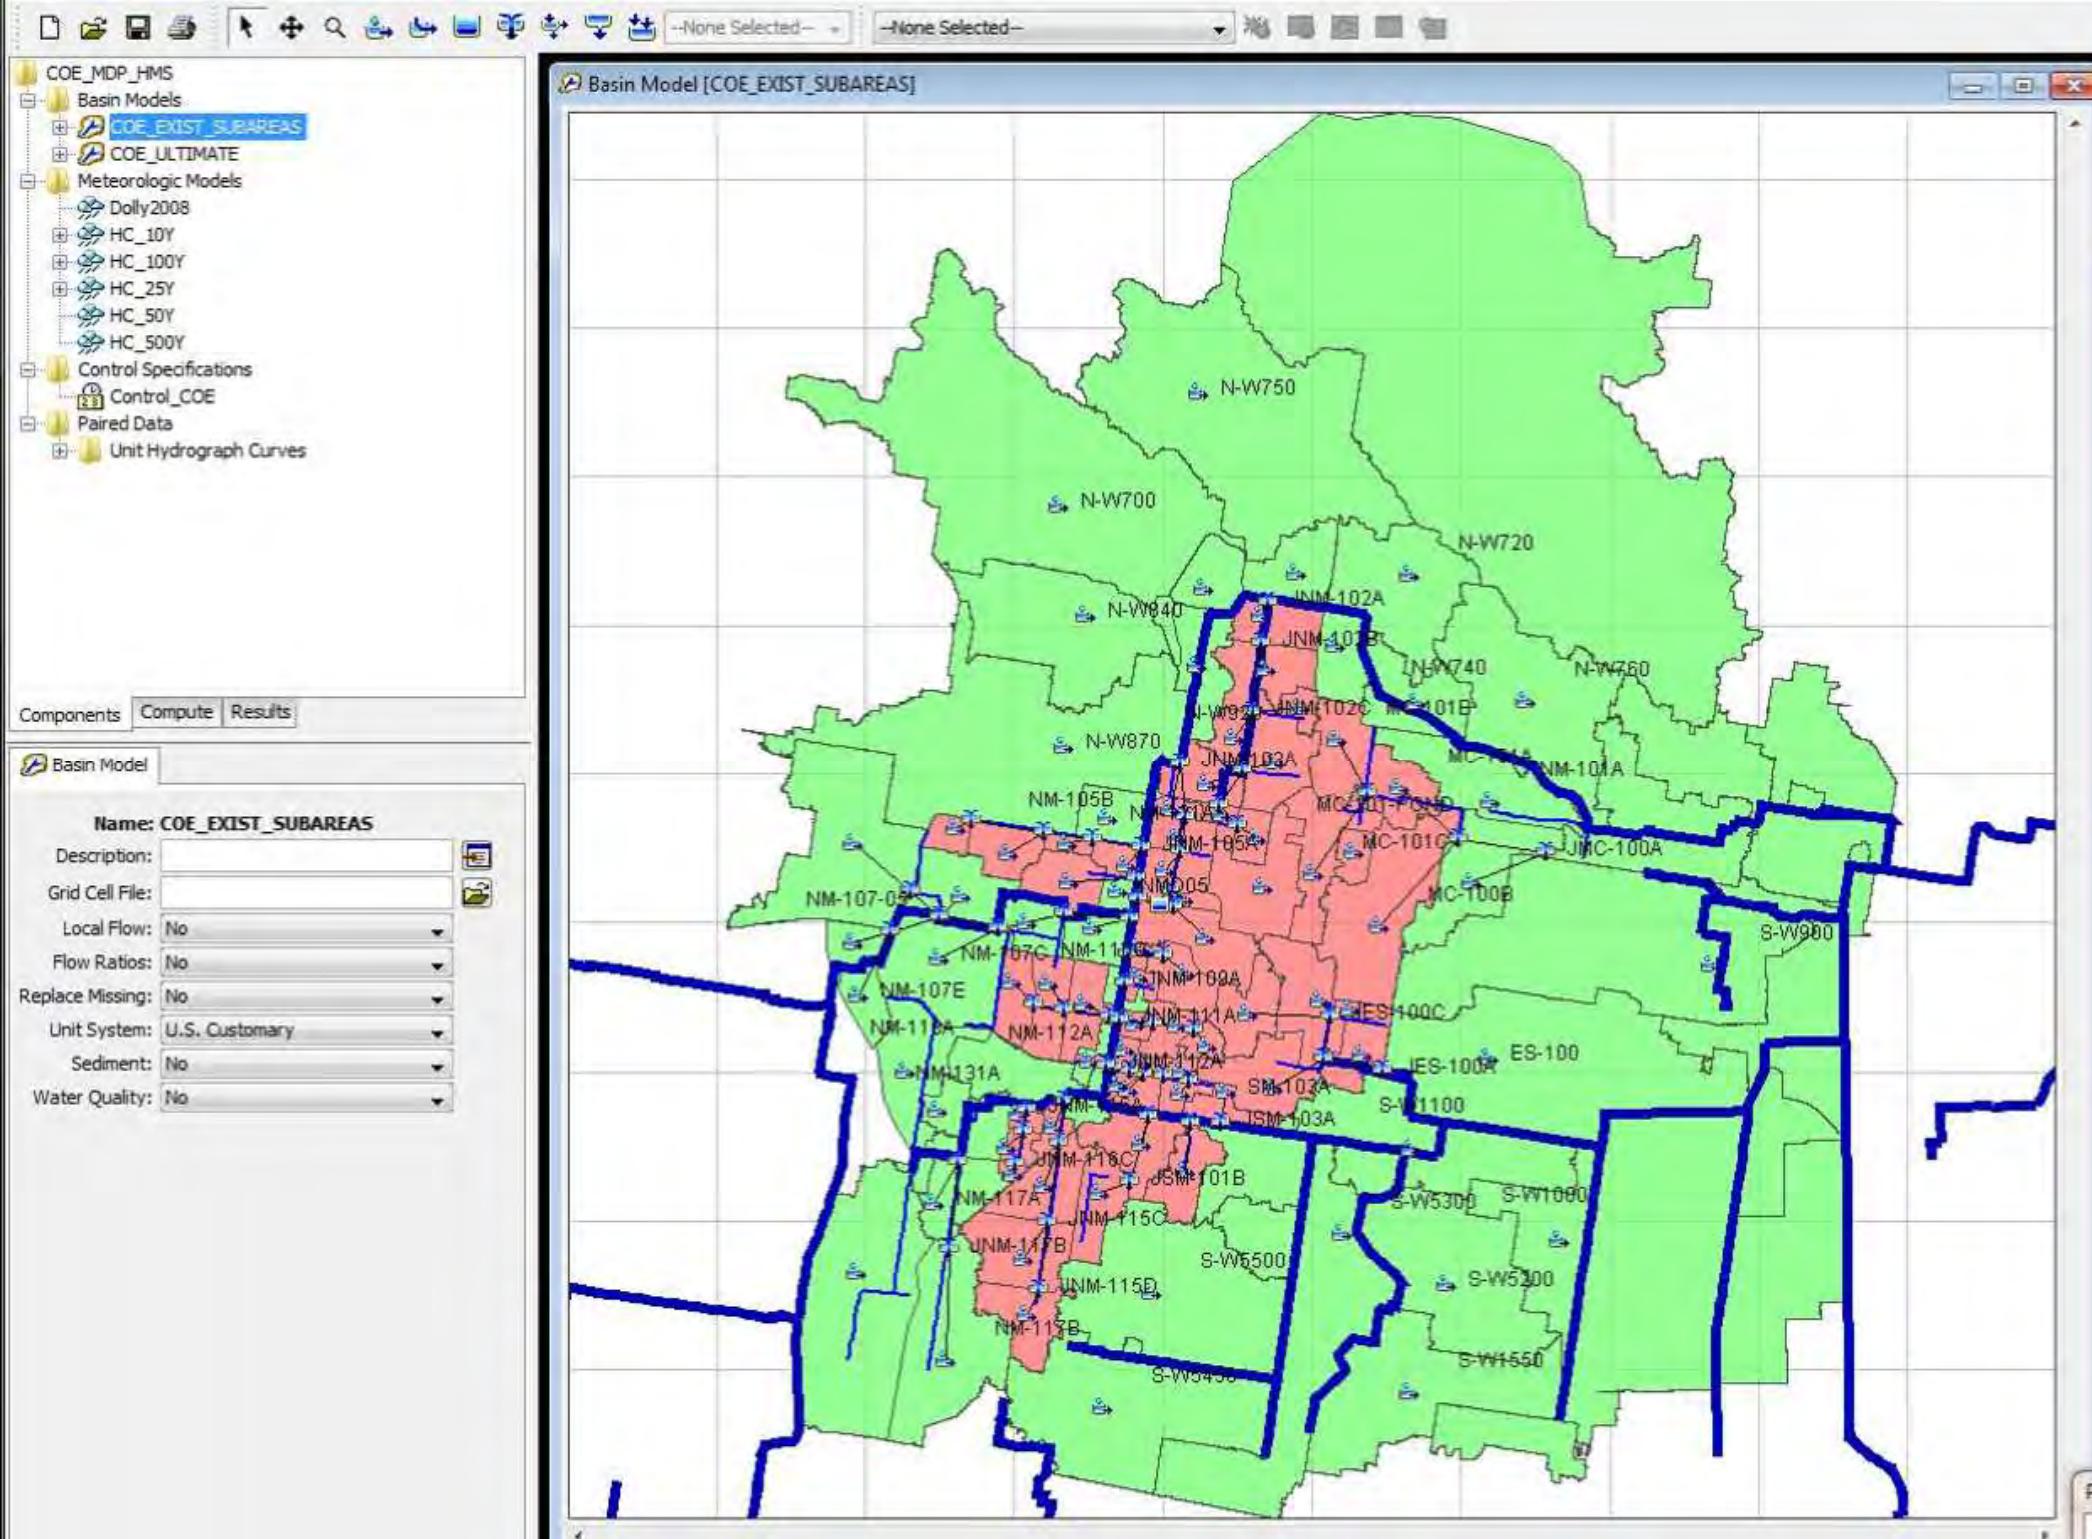

Financial assistance, in the form of low-interest rate loans administrated by TWDB through the Texas Water Development Fund, is potentially available as a funding source to the City of Edinburg for flood control improvement projects. Potential loan repayment sources may include taxes, fees, and/or bond issuances.

OTHER LOCAL FUNDS

Local funds are not limited to the City of Edinburg funds. It can also include funding from the area Drainage Districts, County, and adjoining cities where a shared benefit can be realized. Particularly, on the open drains that lie within adjacent municipalities and/or HCDD1 as well as the City, the adjacent agency may wish to partner with the City and assist in funding and/or construction of the necessary improvements.

HYDRAULICS\NM102\NM102.f01

Plan Summary Information:

Number of: Cross Sections = 26 Multiple Openings = 0
 Culverts = 0 Inline Structures = 0
 Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: Divided flow computed for this cross-section.

Warning: The cross-section end points had to be extended vertically for the computed water surface.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: Divided flow computed for this cross-section.

Warning: The cross-section end points had to be extended vertically for the computed water surface.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: Divided flow computed for this cross-section.

Warning: The cross-section end points had to be extended vertically for the computed water surface.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: Divided flow computed for this cross-section.

Warning: The cross-section end points had to be extended vertically for the computed water surface.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: Divided flow computed for this cross-section.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: Divided flow computed for this cross-section.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance)

NM102 OUTPUT REPORT.TXT

is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.

NM102 OUTPUT REPORT.TXT

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: Slope-Area method could not converge on a starting water surface elevation within the specified number of trials. The program used critical depth as the starting water surface.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Flow Title : NM103 FLOW
Flow File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM103\NM103.f01

Plan Summary Information:

Number of: Cross Sections = 16 Multiple Openings = 0
 Culverts = 0 Inline Structures = 0
 Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

Flow Title : NM105 FLOW
Flow File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM105\NM105.f01

Plan Summary Information:

Number of: Cross Sections = 17 Multiple Openings = 0
 Culverts = 0 Inline Structures = 0
 Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: Divided flow computed for this cross-section.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

NM105 OUTPUT REPORT.TXT

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m) between the current and previous cross section. This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth

NM105 OUTPUT REPORT.TXT
with the lowest, valid, energy was used.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

PROJECT DATA

Project Title: NM108
Project File : NM108.prj

Run Date and Time: 11/3/2014 10:13:21 AM

Project in English units

PLAN DATA

Plan Title: NM108

Plan File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM108\NM108.p01

Geometry Title: NM108

Geometry File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM108\NM108.g01

Flow Title : NM108 FLOW

Flow File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM108\NM108.f01

Plan Summary Information:

Number of:	Cross Sections	=	9	Multiple Openings	=	0
	Culverts	=	0	Inline Structures	=	0
	Bridges	=	0	Lateral Structures	=	0

Computational Information

Water surface calculation tolerance = 0.01

Critical depth calculation tolerance = 0.01

Maximum number of iterations = 20

Maximum difference tolerance = 0.3

Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary

Conveyance Calculation Method: At breaks in n values only

Friction Slope Method: Average Conveyance

Computational Flow Regime: Subcritical Flow

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Flow Title : NM110 FLOW
Flow File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM110\NM110.f01

Plan Summary Information:

Number of: Cross Sections = 14 Multiple Openings = 0
 Culverts = 0 Inline Structures = 0
 Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a

NM110 OUTPUT REPORT.TXT

valid subcritical answer. The program defaulted
to critical depth.

Note: Multiple critical depths were found at this location. The critical depth
with the lowest, valid, energy was used.

C & E Loss (ft)	0.06	Cum SA (acres)		4.20

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

HYDRAULICS\NM111\NM111.f01

Plan Summary Information:

Number of: Cross Sections = 10 Multiple Openings = 0
 Culverts = 0 Inline Structures = 0
 Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

Flow Title : NM112 FLOW
Flow File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM112\NM112.f01

Plan Summary Information:

Number of: Cross Sections = 4 Multiple Openings = 0
 Culverts = 0 Inline Structures = 0
 Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

NM112 OUTPUT REPORT.TXT

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a

HYDRAULICS\NM113\NM113.f01

Plan Summary Information:

Number of: Cross Sections = 11 Multiple Openings = 0
Culverts = 0 Inline Structures = 0
Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

NM113 OUTPUT REPORT.TXT

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: Divided flow computed for this cross-section.

Warning: The conveyance ratio (upstream conveyance divided by downstream

conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Warning: Divided flow computed for this cross-section.

Warning: The conveyance ratio (upstream conveyance divided by downstream

conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, energy was used.

Project Title: NM115
Project File : NM115.prj

Project in English units

PLAN DATA

Plan Title: NM115
Plan File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM115\NM115.p01

Geometry Title: NM115
Geometry File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM115\NM115.g01

Flow Title : NM115 FLOW
Flow File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM115\NM115.f01

Plan Summary Information:

Number of: Cross Sections = 36 Multiple Openings = 0
 Culverts = 0 Inline Structures = 0
 Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

PROJECT DATA

Project Title: NM116
Project File : NM116.prj
Run Date and Time: 11/3/2014 8:42:19 AM

Project in English units

PLAN DATA

Plan Title: NM116
Plan File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM116\NM116.p01

Geometry Title: NM116
Geometry File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM116\NM116.g01

Flow Title : NM116 FLOW
Flow File : K:\2014PROJECTS\COE_MDP_TEDSI\MODEL\APPENDIX C -
HYDRAULICS\NM116\NM116.f01

Plan Summary Information:

Number of: Cross Sections = 7 Multiple Openings = 0
 Culverts = 0 Inline Structures = 0
 Bridges = 0 Lateral Structures = 0

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

Computational Information

Water surface calculation tolerance = 0.01
Critical depth calculation tolerance = 0.01
Maximum number of iterations = 20
Maximum difference tolerance = 0.3
Flow tolerance factor = 0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

Plan Summary Information:

Number of:	Cross Sections	=	58	Multiple Openings	=	0
	Culverts	=	0	Inline Structures	=	0
	Bridges	=	0	Lateral Structures	=	0

Computational Information

Water surface calculation tolerance	=	0.01
Critical depth calculation tolerance	=	0.01
Maximum number of iterations	=	20
Maximum difference tolerance	=	0.3
Flow tolerance factor	=	0.001

Computation Options

Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in values only
Friciton Slope Method: Average Conveyance
Computational Flow Regime: Subcritical Flow

Warning: Divided flow computed for this cross-section.

Warning: The cross-section end points had to be extended vertically for the computed water surface.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: Divided flow computed for this cross-section.

Warning: The cross-section end points had to be extended vertically for the computed water surface.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4.

This may indicate the need for additional cross sections.

Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

FEMA BCA TOOL DETAIL OUTPUT REPORT**

BENEFIT-COST ANALYSIS SUMMARY

City of Edinburg Master Drainage Plan

Benefit-Cost Analysis Summary

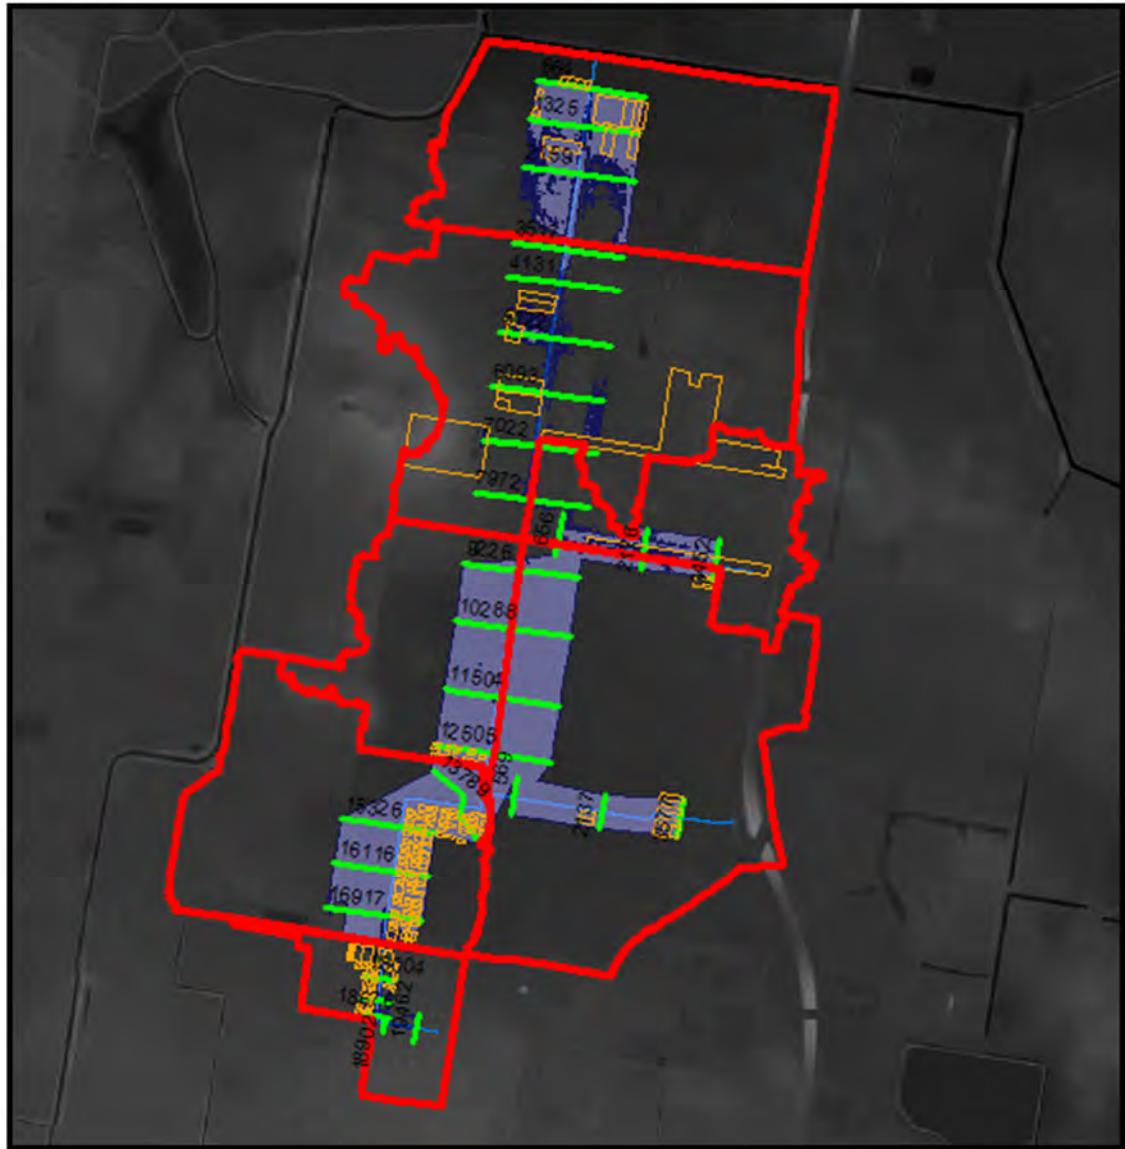

A benefit-cost analysis was performed for each individual drainage system and the entire project using FEMA Benefit-Cost Analysis (BCA) Tool (v5.0). The BCR values for the project systems ranged from 0.89 to 8.10 with a resulting overall Benefit-Cost Ratio (BCR) for the entire Master Drainage Plan project computed as 2.99. The economic benefits are defined as the expected flood loss reduction due to the flood water surface elevation reduction from the proposed drainage improvements based on 10-, 50-, 100-, and 500-year storm events. The U.S. Army Corps of Engineers' generic depth-damage curves were utilized for this analysis.

Since this is a planning level of project, representative structures were used in the model with the cost per square foot applied to the total number of structures multiplied by the average structure square footage. Due to the level of commercial property within the ES100 lateral system drainage area, the benefit analysis for this system utilized residential and non-residential representative structure values to determine the benefit ratio.

**RE: Phase I Environmental Site Assessment & Constraints Map
City of Edinburg Master Drainage Plan – 16 Outfall Locations
Edinburg, Hidalgo County, Texas**

Dear Mr. Luper:

Raba Kistner Environmental, Inc. (RKEI) is pleased to forward the attached Phase I Environmental Site Assessment (ESA-I) and Constraints Map report for the above-referenced properties. This report was prepared for TEDSI Infrastructure Group (CLIENT) and may not provide sufficient information for other parties. If other parties wish to rely on this report, please have them contact us so that a mutual understanding and agreement of the terms and conditions for our services can be established prior to their use of this information. Reliance on the information provided in this ESA-I report for the purposes of conducting "All Appropriate Inquiry" (AAI) is subject to the conditions in ASTM E 1527-05 §4.6 describing the continued viability of an ESA-I.

We appreciate the opportunity to be of professional service to you on this important project. Should there be any questions or additional information required, please contact our office at your earliest convenience.

Very truly yours,

RABA KISTNER ENVIRONMENTAL, INC.

EXECUTIVE SUMMARY

As authorized by Mr. Mark Luper, P.E., RPLS, CFM – Executive Vice President – with TEDSI Infrastructure Group (CLIENT), **Raba Kistner Environmental, Inc. (RKEI)** has completed a Phase I Environmental Site Assessment (ESA-I) and Constraints Map for the City of Edinburg Master Drainage Plan – 16 Outfall Locations designated as four City sectors located throughout the City of Edinburg, Hidalgo County, Texas; hereinafter referred to as the SITE (Northeast, Southeast, Northwest, Southwest).

This ESA-I was performed in accordance with **RKEI** Proposal Number PSF13-344-00, dated November 06, 2013. The American Society of Testing and Materials (ASTM) Practice E 1527-05, Environmental Site Assessments: Phase I Environmental Site Assessment Process, was used as a guidance document for the performance of the ESA-I.

The SITE reconnaissance was performed by **RKEI** on January 24, 2014. The findings, opinions, conclusions, and recommendations developed during this ESA-I are presented as follows:

- The SITE was observed as 16 earthen drainage ditch outfall locations in Northeast, Southeast, Northwest and Southwest sectors of the City of Edinburg, Hidalgo County, Texas. Based on CLIENT provided outfall mapping data, concrete outfall piping was observed at 15 locations with one likely a proposed location for outfall piping installations. The SITE Northeast, Southeast, Northwest and Southwest outfall locations are accessible primarily via private, gated drainage ditch right-of-ways.
- During SITE reconnaissance activities, **RKEI** observed no evidence of the following: bulk storage of hazardous materials and/or petroleum products in underground or aboveground storage tanks (USTs/ASTs); process wastewater generation; oil or gas wells; hazardous material usage; stained soils or stressed vegetation; suspect polychlorinated biphenyls (PCBs) or other features that would suggest potential *recognized environmental conditions* associated with the SITE.
- Current use of SITE Northeast, Southeast, Northwest and Southwest adjacent properties includes a combination of vacant/undeveloped land, cultivated farmland, citrus crop farmland, native brushland, public thoroughfares, single-family residential development, multi-family residential development, commercial, church and school developments. Field observations indicated no readily observable *recognized environmental conditions* in connection with the adjacent properties.
- **RKEI** reviewed available historical aerial photography dated 1939, 1955, 1961, 1977, 1980, 1995, 2004, 2008 and 2012 to determine historical use of the SITE Northeast, Southeast, Northwest and Southwest outfall locations. Throughout the aerial photographs the SITE locations are depicted as vacant/undeveloped land until 1980 with increased development into drainage ditch and outfall locations after 1980 until 2012. Throughout the aerial photographs adjacent properties are depicted generally as vacant/undeveloped land, farmland and public thoroughfares, single-family residential development, multi-family residential development, commercial, church and school developments, as observed during recent SITE reconnaissance activities. No imagery suggesting adverse environmental conditions (i.e., heavy industrial, landfill usage) for the SITE Northeast, Southeast, Northwest and Southwest outfall locations, or adjacent properties was discerned in review of the referenced historical aerial photographs.

- A search of federal (U.S. Environmental Protection Agency) and state (Texas Commission on Environmental Quality [TCEQ]) regulatory databases revealed forty-four (44) regulated facilities within the standard search radius of the SITE Northeast, Southeast, Northwest and Southwest outfall locations, as defined by the ASTM Standard E 1527-05. However, based on regulatory database information reviewed, none of the findings are considered environmental concerns to the SITE Northeast, Southeast, Northwest and Southwest outfall locations.
- Based on the information reviewed, there was no evidence that the subject or adjacent properties are currently under federal or state environmental enforcement action. The SITE reconnaissance, regulatory database review, and historical review, revealed no evidence to suggest that there are any potential environmental concerns associated with the SITE Northeast, Southeast, Northwest and Southwest outfall locations that would preclude construction or development activities from an environmental standpoint.
- RKEI has performed a Phase I Environmental Site Assessment for 16 Outfall Locations designated as four City sectors located throughout the City of Edinburg, Hidalgo County, Texas; the SITE Northeast, Southeast, Northwest and Southwest. A SITE Constraints Map is also included in this ESA-I. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the SITE Northeast, Southeast, Northwest and Southwest outfall locations.
- Based on the information developed as the result of this ESA-I, no further environmental assessment activities are recommended for the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

This executive summary is for an overview only and should not be relied upon as the sole source of the reported results without first reading the full contents of this report, including appended materials.

INTRODUCTION

PURPOSE

The purpose of this Phase I Environmental Site Assessment (ESA-I) is to define good commercial and customary practice in the United States of America for conducting an environmental site assessment of a parcel of commercial real estate with respect to the range of contaminants within the scope of Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (42 U.S.C. §9601) and petroleum products. This ESA-I is intended to permit CLIENT (*user*) to satisfy one of the requirements to qualify for the *innocent landowner, contiguous property owner, or bona fide prospective purchaser* limitations to CERCLA liability a.k.a. "*landowner liability protections*," or "*LLPs*": That is, to provide documentation that "appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in 42 USC § 9601(35) (B). Information about the SITE regarding recognized past or current uses of hazardous substances or evidence of contaminants within the scope of CERCLA and petroleum products is reported herein and is subject to the limitations, terms, and conditions described in the following section.

SCOPE OF SERVICES

This ESA-I was performed in accordance with **RKEI** Proposal Number PSF13-344-00, dated November 06, 2013. The ASTM Practice E 1527-05, Environmental Site Assessments: Phase I Environmental Site Assessment Process, was used as a guidance document for the performance of the ESA-I. Specifically, the scope of work for the ESA-I include the following components as a minimum: 1) Interviews with past and present owners; 2) Interviews with local government officials; 3) Review of historical sources of information; 4) Review of federal, state, tribal, and local government records; 5) Site reconnaissance by an Environmental Professional; and 6) Report preparation.

LIMITATIONS AND EXCEPTIONS OF ASSESSMENT

"*Recognized environmental conditions*" as defined by ASTM, means "the presence or likely presence of any hazardous substances or petroleum products on the SITE under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the SITE or into the ground, groundwater, or surface water of the SITE. This term is not intended to include *de minimus* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies." In general, the ESA-I is a risk management process. It is intended to reduce environmental risk, not wholly eliminate it.

The conclusions and recommendations of this ESA-I are based upon: 1) Research and evaluation of readily available and practically reviewable documents and databases; 2) Interviews with persons knowledgeable about the SITE; and 3) Site reconnaissance by an environmental professional. **RKEI** makes no warranty, expressed or implied, as to the accuracy or completeness of the information provided by the various governmental regulatory agencies and other referenced information sources used during this ESA-I. This ESA-I does not address requirements of any state, local or federal laws other than the *appropriate inquiry* provisions of CERCLA's *innocent landowner defense*. Other legal obligations with regard to hazardous substances or petroleum products discovered on the SITE are beyond the scope of work for this ESA-I. This ESA-I does not include sampling or analyses of any kind unless authorized in writing by CLIENT.

This assessment was conducted at the request of CLIENT utilizing methods and procedures consistent with good commercial or customary practices designed to conform to industry standards. The independent conclusions represent the best professional judgment of the Environmental Professional based on the conditions that existed and the information and the data available to **RKEI** during the course of this assignment. Factual information regarding operations, conditions and test data provided by CLIENT, owner, or their representative has been assumed to be correct and complete.

This ESA-I does not include intrusive investigations or sampling or analyses of any kind unless authorized as additional scope considerations. Furthermore, the location or identification of undocumented buried tanks or concealed wastes, hidden conditions, and subsurface conditions are not included.

SPECIAL TERMS AND CONDITIONS

No special terms or conditions were applicable to this ESA-I report.

USER RELIANCE

This report was prepared on behalf and for the sole use of CLIENT and may not provide adequate information for other parties. If other parties wish to rely on this report, please have them contact us so that a mutual understanding and agreement of the terms and conditions for our services can be established prior to their use of this information. Reliance on the information and conclusions presented in this report by any other parties is not authorized by **RKEI**.

RKEI will not extend reliance or liability on the information provided in this ESA-I report beyond ASTM E 1527's "shelf life" requirements of one year unless an update assessment has been performed by **RKEI** after 180 days per ASTM E 1527-05 §4.6 describing the continued viability of an ESA-I.

Moreover, due to requirements developed by the U.S. Small Business Administration (SBA) as a result of SOP50-10[5] effective June 2008 (revised March 2009), **RKEI** cannot extend reliance on the ESA-I report to the SBA or its development company loan programs (a.k.a. Certified Development Company [CDC]), should CLIENT seek funding through the SBA or its CDC under an SBA 7(a) and 504 loan program.

PROPERTY DESCRIPTION

PROPERTY LOCATION

The subject property is comprised of the City of Edinburg Master Drainage Plan – 16 Outfall Locations designated as four City sectors located throughout the City of Edinburg, Hidalgo County, Texas; the SITE Northeast, Southeast, Northwest and Southwest. The SITE Northeast, Southeast, Northwest and Southwest outfall locations are accessible primarily via private, gated drainage ditch right-of-ways.

An Area Location Map is provided in **Figure 1**.

LEGAL DESCRIPTION

Commitment for title insurance or chain-of-title run documentation identifying legal descriptions for the SITE was not developed by and/or provided to **RKEI** during this ESA-I process.

CURRENT USE OF PROPERTY

At the time of the site reconnaissance, **RKEI** observed the SITE as 16 earthen drainage ditch outfall locations in Northeast, Southeast, Northwest and Southwest sectors of the City of Edinburg.

DESCRIPTION OF STRUCTURES, ROADS, OR OTHER IMPROVEMENTS

Other than concrete outfall drainage piping and earthen drain ditch excavated features, no structures, roads or other significant improvements were observed at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Photographs taken during the SITE reconnaissance are presented in **Attachment A**.

CURRENT USE OF ADJACENT PROPERTIES

Current use of SITE Northeast, Southeast, Northwest and Southwest adjacent properties includes a combination of vacant/undeveloped land, cultivated farmland, citrus crop farmland, native brushland, public thoroughfares, single-family residential development, multi-family residential development, commercial, church and school developments.

Field observations indicated no readily observable *recognized environmental conditions* in connection with the adjacent properties.

USER PROVIDED INFORMATION

The purpose of the information is to describe tasks to be performed by the *user* that will assist in the identification of possible *recognized environmental conditions* in connection with the SITE. The *user* is defined by ASTM E 1527-05 as: The party seeking to use Practice E 1527 to complete an environmental site assessment of the property. A *user* may include, without limitation, a potential purchaser of property, a potential tenant of property, an owner of property, a lender, or a property manager. The *user* has specific obligations for completing a successful application of this Practice as defined in ASTM E 1527-05 §6.0 describing the *user's* responsibilities.

ASTM E 1527-05 *user* questionnaire was not completed by any parties during this ESA-I process.

RECORDS REVIEW

PHYSICAL SETTING

Topography

According to the *1984 Edinburg, Texas and 1984 La Blanca, Texas United States Geological Survey (USGS) Topographic Maps* (**Figure 2**), the surface elevation of the SITE Northeast, Southeast, Northwest and Southwest outfall locations ranges from approximately 80 to 100 feet above mean sea level with topographic relief towards the east/southeast.

Geology

According to the *1976 Geological Atlas of Texas, McAllen-Brownsville Sheet*, published by the Bureau of Economic Geology at The University of Texas in Austin, the underlying geologic formation of the SITE is of the following: (i) SITE Northeast: *Windblown Deposits (map unit Qds)*, *Lissie Formation undivided (map unit QI)*; (ii) SITE Southeast: *Lissie Formation undivided (QI)*; (iii) SITE Northwest: *Windblown Deposits (Qds)*, *Lissie Formation undivided (QI)*, *Goliad Formation (map unit Pg)*; and (iv) SITE Southwest: *Windblown Deposits (Qds)*, *Lissie Formation undivided (QI)*.

Qds is predominantly comprised of stabilized sand dune deposits of strong relict eolian grain and sparse grass of moderate to very high permeability, low to moderate water holding capacity, low compressibility, low shrink-swell potential, good to fair drainage, high shear strength, low plasticity and shallow water table.

QI is predominantly comprised of clay, silt, sand, gravel and caliche materials; gray to brown to pale yellow, gravel mainly silicious, locally cemented by and interbedded with sandy caliche; caliche massive to nodular; surface characterized by many undrained circular to irregular depressions, by relict clay dunes, and by stabilized northwest-trending longitudinal dunes.

Pg is predominantly clay, sand, sandstone, marl, caliche, limestone, and conglomerate of thicknesses of 100-500 feet.

Soil Survey

According to the *1981 United States Department of Agriculture – Soil Survey of Hidalgo County, Texas*, the soils for the SITE are mapped as the following: (i) SITE Northeast: *Hidalgo County sandy clay loam of 0-1% slopes (map unit 28)*; (ii) SITE Southeast: *Hidalgo County sandy clay loam of 0-1% slopes (28)*; (iii) SITE Northwest: *Hidalgo fine sandy loam of 0-1% slopes (map unit 25)*, *Hidalgo fine sandy loam of 0-3% slopes (map unit 26)*, *Hidalgo County sandy clay loam of 0-1% slopes (28)*, *Hidalgo sandy clay loam, saline of 0-1% slopes (map unit 30)*, *Raymondville clay loam (map unit 52)*; and (iv) SITE Southwest: *Brennan fine sandy loam of 0-1% slopes (map unit 3)*, *Hidalgo County sandy clay loam of 0-1% slopes (28)*, *Hidalgo-Urban land complex of 0-3% slopes (map unit 31)*.

The Brennan fine sandy loam (0-1% slopes) series (3) consists of deep, nearly level, well drained, loamy soils on convex uplands. These soils are formed of sandy clay loam to approximately 65 inches below ground surface. The soil is well drained, surface runoff is medium, permeability is medium, and the available water capacity is medium. Potential is high for urban and recreational uses.

The Hidalgo fine sandy loam (0-1% slopes) series (25) consists of deep, nearly level soil on convex uplands. Typically, the surface layer is dark grayish brown fine sandy loam about 15 inches thick. The upper part of the subsoil, from 15 to 30 inches, is brown sandy clay loam. The lower part, from 30 to 39 inches, is pale brown sandy clay loam. The layer extending from 39 to 72 inches is very pale brown sandy clay loam. The soil is calcareous throughout. This soil is well drained, surface runoff is slow, permeability is moderate and the available water capacity is moderate. Potential is medium for urban uses and high for recreation uses.

The Hidalgo fine sandy loam (0-3% slopes) series (26) consists of deep, gently sloping soil is on convex uplands. Typically, the surface layer is dark grayish brown fine sandy loam about 17 inches thick. The upper part of the subsoil, to a depth of 37 inches, is brown sandy clay loam. The lower part, to a depth of 49 inches, is pale brown sandy clay loam. The layer extending to a depth of 65 inches is very pale brown sandy clay loam. The soil is calcareous throughout. This soil is well drained, surface runoff is medium, permeability is moderate and the available water capacity is medium. Potential is medium for urban uses and high for recreation uses.

The Hidalgo sandy clay loam (0-1% slopes) series (28) consists of deep, well-drained, loamy soils on convex uplands. These soils formed in calcareous loamy and clayey sediments. Typically, the surface layer is dark grayish brown, brown, and pale brown sandy clay loam and clay loam to an approximate depth of 6.67 feet below ground surface. The soil is well drained, surface runoff is slow, permeability is moderate, and the available water capacity is high. The main limitations are shrinking and swelling of the soil and high corrosivity to uncoated steel.

The Hidalgo sandy clay loam, saline (0-1% slopes) series (30) consists of deep, nearly level saline soil on convex uplands. Typically, the surface layer is saline, dark grayish brown sandy clay loam of about 15 inches thick. The next layer from 15-25 inches is saline, brown sandy clay loam. The next layer from 25-36 inches is saline, pale brown clay loam. The soil is calcareous throughout. The soil is well drained, surface runoff is slow, and permeability is moderate. Potential is low for urban and recreation uses. The main limitations are wetness and high corrosivity to uncoated steel.

The Hidalgo-Urban land complex (0-3% slopes) series (31) consists of nearly level to gently sloping Hidalgo soil and Urban land in areas that are broad and irregular in shape and range in size from 10 to 900 acres or more. Hidalgo soil makes up 35 to 80 percent of this map unit, Urban land 15 to 55 percent, and other soils 5 to 10 percent. Typically, Hidalgo soil has a surface layer of dark grayish brown sandy clay loam about 11 inches thick. The next layer, from 11 to 38 inches, is grayish brown sandy clay loam. The layer extending from 38 to 65 inches is very pale brown sandy clay loam. In some areas the surface layer is fine sandy loam. The soil is calcareous throughout. Urban land consists of areas that are covered by buildings and other urban structures, which make their classification impractical. Typical structures are single or multiple-unit dwellings, garages, sidewalks, patios, driveways, streets, schools, churches, shopping centers on less than 40 acres, office buildings, paved parking lots and industrial sites. Some areas of the Hidalgo soil have been altered by cutting, grading, and filling over the surface layer with 6 to 24 inches of loamy

material. The main limitations for these soils are moderate shrink-swell potential and high corrosivity to uncoated steel.

The Raymondville clay loam series (52) consists of deep, moderately well drained, calcareous soils that are nearly level and are on deltas or coastal terraces. Slopes are less than 0.5 percent, and the surface is plane to slightly concave. In a representative profile the surface layer is calcareous clay loam about 14 inches thick that is gray in the upper part and dark gray in the lower part. The next layer is gray clay loam about 11 inches thick. Beneath this, to a depth of about 78 inches, is clay. Permeability is slow and runoff is slow.

Groundwater Depth and Movement

Occasionally, groundwater occurs in shallow, discontinuous or “perched” water-bearing units. These shallow water-bearing units are the groundwater zones most likely to be impacted by releases from underground storage tank systems or surface spills.

No actual groundwater data was readily available for the SITE. In general, groundwater tends to mimic surface topography with influence towards area streams, creeks, rivers, etc. The general topographic grade of the SITE vicinity is to the east/southeast.

HISTORICAL RECORDS

The objective of consulting historical sources is to develop a history of the previous uses of the property and surrounding area in order to help identify the likelihood of past uses having led to *recognized environmental conditions* in connection with the property.

Historical Property Use

RKEI reviewed available historical aerial photography dated 1939, 1955, 1961, 1977, 1980, 1995, 2004, 2008 and 2012 (**Attachment B**) to determine historical use of the SITE Northeast, Southeast, Northwest and Southwest outfall locations. Throughout the aerial photographs the SITE locations are depicted as vacant/undeveloped land until 1980 with increased development into drainage ditch and outfall locations after 1980 until 2012.

No imagery suggesting adverse environmental conditions (i.e., heavy industrial, landfill usage) for the SITE Northeast, Southeast, Northwest and Southwest outfall locations was discerned in review of the referenced historical aerial photographs.

City Directories

City directories such as R. L. Polk & Co., Morrison & Fourmy, Coles, or Criss-Cross include year-by-year listings of property occupancy by address. Based on review of aerial photography, the SITE Northeast, Southeast, Northwest and Southwest outfall locations have consisted of vacant/undeveloped land and drainage ditch and outfall features with no evidence of structural development for occupancy. As a result, a city directory search was deemed unnecessary as part of this ESA-I process.

Sanborn Maps

In the late nineteenth century, the Sanborn Company began preparing property usage maps for use by fire insurance companies. However, these maps were discontinued in the early 1970's and did not include undeveloped properties such as the SITE Northeast, Southeast, Northwest and Southwest outfall locations, at that time. Based on a January 28, 2014 review of The University of Texas Perry-Castañeda online Texas Sanborn Maps, (<http://www.lib.utexas.edu/maps/sanborn/p.html>), a Sanborn Map for the City of Edinburg dated 1925, does not include coverage for the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Recorded Land Title Records

A chain-of-title run or commitment for title insurance documentation identifying current ownership of the SITE was not developed by and/or provided to **RKEI** during this ESA-I process.

Historical Topographic Maps

RKEI reviewed two historical topographic maps titled *Edinburg, Texas (1930, 1936)* on January 28, 2014 via The University of Texas Perry-Castañeda Library Map Collection (<http://www.lib.utexas.edu/maps/topo/texas/s.html>) to assist in determining historical use of the SITE. In the topographic maps reviewed, the SITE Northeast, Southeast, Northwest and Southwest outfall locations are depicted primarily as rural and undeveloped areas.

No imagery suggesting adverse environmental conditions (i.e., industrial usage, landfills, etc.) for the SITE Northeast, Southeast, Northwest and Southwest outfall locations was discerned in review of the above-referenced historical sources.

Historical Use of Adjacent Properties

RKEI reviewed available historical aerial photography dated 1939, 1955, 1961, 1977, 1980, 1995, 2004, 2008 and 2012 to determine historical use of the SITE Northeast, Southeast, Northwest and Southwest outfall location adjacent properties. Throughout the aerial photographs dating to 1980, adjacent properties are depicted generally as vacant/undeveloped land, farmland and public thoroughfares. Beyond 1980 to 2012, structural development is depicted and appears to resemble public thoroughfares, single-family residential development, multi-family residential development, commercial, church and school developments, as observed during recent SITE reconnaissance activities.

No imagery suggesting adverse environmental conditions (i.e., heavy industrial, landfill usage) for the SITE Northeast, Southeast, Northwest and Southwest outfall location adjacent properties was discerned in review of the referenced historical aerial photographs.

STANDARD ENVIRONMENTAL RECORDS REVIEW

The objective of the environmental regulatory agency database review is to obtain and review records that will help identify "recognized environmental conditions" in connection with the property. The regulatory

database search was performed by Banks Environmental Data (The Banks Regulatory Database Report™). The Banks Regulatory Database Report™ is presented in **Attachment C**. This report meets the government records search requirement of ASTM E 1527-05. The following is an overview of the databases searched and the findings:

SITE NORTHEAST

Federal Databases:

NPL Report: The National Priority List (NPL) is a list of sites identified by the federal government as having a priority for cleanup. The NPL appears in the Code of Federal Regulations, CFR 40, Parts 190 to 399. The standard search radius for NPL sites is one (1) mile.

- No NPL findings were reported within the search area.

NPL Delisted: The National Priority List (NPL) Delisted consists of a database of delisted Superfund sites. The standard search radius for NPL Delisted sites is one-half (½) mile.

- No NPL Delisted findings were reported within the search area.

CERCLIS Report: The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Information System (CERCLIS) is compiled by the federal government and includes sites which could possibly be contaminated and may require cleanup. Many of the properties that appear on the CERCLIS List have not been thoroughly investigated. The standard search radius for CERCLA sites is one-half (½) mile.

- No CERCLIS findings were reported within the search area.

NFRAP Report: The No Further Remedial Action Planned (NFRAP) Report includes sites, which have been determined by the EPA, following preliminary assessment, to no longer pose a significant risk or require further activity under CERCLA. After initial investigation, no contamination was found, contamination was quickly removed or contamination was not serious enough to require Federal Superfund action or National Priorities List (NPL) consideration. The standard search radius for NFRAP sites is one-half (½) mile.

- No NFRAP findings were reported within the search area.

RCRA COR ACT: Corrective Action (COR ACT) lists Resource Conservation and Recovery Information System (RCRIS) Sites that are currently under corrective action. The standard search radius for COR ACT facilities is one (1) mile.

- No RCRA COR ACT findings were reported within the search area.

RCRA TSD: The RCRIS serves to track the status of all registrations, permits, reports, inspections, enforcement activities, and financial data of all sites which are generators and/or treatment, storage, and

disposal facilities of hazardous wastes regulated under the RCRA. The RCRA Treatment Storage or Disposal (TSD) is a subset of the RCRIS list. The standard search radius for TSD facilities is one-half ($\frac{1}{2}$) mile.

- No RCRA TSD findings were reported within the search area.

RCRA GEN: Database of facilities that generate or transport hazardous wastes or meet other RCRA requirements such as Large Quantity Generators (LQG), Small Quantity Generators (SQG), Conditionally Exempt Small Quantity Generator (CESQG). Included are RCRA Administrative Action Tracking System (RAATS) and Compliance Monitoring & Enforcement List (CMEL) facilities. The standard search for RCRA Generators (GEN) facilities is for the SITE and adjacent properties.

- No RCRA GEN findings were reported within the search area.

Federal Institutional Control/Engineering Controls: The Federal Institutional Control/Engineering Control (IC/EC) is a database for Superfund sites that have either engineering or an institutional control placed on the property. The data includes the control and the media contaminated. The standard search for Federal IC/EC sites is for the SITE only.

- No Federal IC/EC findings were reported for the SITE.

Federal Brownfield: A listing of Federal Brownfield (FED BWN) sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that are either abandoned or underutilized where redevelopment or expansion is complicated by real or perceived environmental contamination. The approximate minimum search distance for FED BWN sites is one-half ($\frac{1}{2}$) mile.

- No Federal Brownfield findings were reported within the search area.

ERNS: The Federal "Emergency Response Notification System" (ERNS) documents sites or facilities that have been reported as areas subjected to or impacted by spills or discharges of hazardous substances. The standard search for ERNS facilities is for the SITE only.

- No ERNS findings were reported for the SITE.

State Databases:

State/Tribal Sites (NPL): This State/Tribal Sites is a TCEQ database listing of sites contained in the State Superfund Registry. The standard search radius for State/Tribal Sites is one (1) mile.

- No State/Tribal Site findings were reported within the search area.

State/Tribal Disposal or Landfill (SWL): Solid Waste Landfills (SWL) maintained by the TCEQ Municipal Solid Waste Landfill (MSWLF) Registration and Permit Database serves to track permits and registration for landfills, transfer stations, sludge application sites, illegal dumping sites, recycling facilities, medical generators and transporters. The standard search radius for SWL facilities is one-half ($\frac{1}{2}$) mile.

- No State/Tribal SWL findings were reported within the search area.

State/Tribal Leaking PST: The Leaking Petroleum Storage Tank (LPST) List is maintained by the TCEQ under the LPST Program. The standard search radius for LPST sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal Leaking PST findings were reported within a one-quarter ($\frac{1}{4}$) mile radius of the SITE.

State/Tribal Storage Tanks (UST/AST): Underground and aboveground storage tanks (USTs/ASTs) are tracked by the TCEQ under the Petroleum Storage Tank (PST) Program. The standard search for PST facilities is for the SITE and adjacent properties.

- One State/Tribal Storage PST finding was reported for a SITE adjacent property:

Evins Regional Juvenile Center, Facility ID# 0055834, located at 3801 E. Monte Cristo Rd, 0.23 miles northwest of the SITE. This facility is reported to have 1- 2,000-gallon fiberglass reinforced plastic coated steel UST used for gasoline storage/dispensing. The facility does not have a past or present LPST status.

Based on the information reviewed for this finding, it is RKEI's opinion that impact to the SITE from the reported facility is unlikely.

State/Tribal VCP: Listing of all sites in the Voluntary Cleanup Program (VCP) and Innocent Owner/Operator Program (IOP). Some VCP and IOP sites are noted as having institutional controls placed on the property. The standard search radius for State/Tribal VCP sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal VCP findings were reported within the search area.

State/Tribal Engineering Controls (EC): TCEQ database listing in the VCP and IOP where engineering controls have been placed on the property. The standard search for State/Tribal EC sites is for the SITE only.

- No State/Tribal EC findings were reported for the SITE.

State/Tribal Institutional Controls (IC): TCEQ database listing in the VCP and IOP where institutional controls have been placed on the property. The standard search for State/Tribal IC sites is for the SITE only.

- No State/Tribal IC findings were reported for the SITE.

State/Tribal Brownfields: Listing of all former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. Some sites are noted as having institutional controls placed on the property. The standard search radius for State/Tribal Brownfield sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal Brownfield findings were reported within the search area.

Industrial Hazardous Waste (IHW): This database includes Texas Industrial Hazardous Waste Notice of Registration (IHW NOR) data. The TCEQ enters all information submitted by industrial and hazardous waste transporters, receivers (including recyclers), generators and one time shipments into a database that tracks industrial and hazardous waste generation and management activities in the State of Texas. All facilities of these types receive a solid waste registration number. IHW facilities are searched for one-quarter ($\frac{1}{4}$) mile.

- No State IHW sites were reported within the search area.

Non-ASTM/AAI Required Databases:

RCRA: This database lists all sites that fall under the RCRA and are not classified as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action requirements. RCRA facilities are searched for one-quarter ($\frac{1}{4}$) mile.

- No RCRA facilities were identified within the search area.

Dry Cleaners (DRYC and DCRP): Dry Cleaner data houses both the Dry Cleaner Remediation Program (DCRP) and perchloroethylene (PERC) information released by the TCEQ. The DCRP database contains records funded for state-led cleanup of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. This database also lists active dry cleaning facilities and drop stations registered with the TCEQ as DRYC. The search radius for DCRP and DRYC facilities is one-quarter ($\frac{1}{4}$) mile.

- No DRYC or DCRP findings were reported within the search area.

SITE SOUTHEAST

Federal Databases:

NPL Report: The National Priority List (NPL) is a list of sites identified by the federal government as having a priority for cleanup. The NPL appears in the Code of Federal Regulations, CFR 40, Parts 190 to 399. The standard search radius for NPL sites is one (1) mile.

- No NPL findings were reported within the search area.

NPL Delisted: The National Priority List (NPL) Delisted consists of a database of delisted Superfund sites. The standard search radius for NPL Delisted sites is one-half ($\frac{1}{2}$) mile.

- No NPL Delisted findings were reported within the search area.

CERCLIS Report: The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Information System (CERCLIS) is compiled by the federal government and includes sites which could possibly be contaminated and may require cleanup. Many of the properties that appear on the CERCLIS

List have not been thoroughly investigated. The standard search radius for CERCLA sites is one-half ($\frac{1}{2}$) mile.

- No CERCLIS findings were reported within the search area.

NFRAP Report: The No Further Remedial Action Planned (NFRAP) Report includes sites, which have been determined by the EPA, following preliminary assessment, to no longer pose a significant risk or require further activity under CERCLA. After initial investigation, no contamination was found, contamination was quickly removed or contamination was not serious enough to require Federal Superfund action or National Priorities List (NPL) consideration. The standard search radius for NFRAP sites is one-half ($\frac{1}{2}$) mile.

- No NFRAP findings were reported within the search area.

RCRA COR ACT: Corrective Action (COR ACT) lists Resource Conservation and Recovery Information System (RCRIS) Sites that are currently under corrective action. The standard search radius for COR ACT facilities is one (1) mile.

- No RCRA COR ACT findings were reported within the search area.

RCRA TSD: The RCRIS serves to track the status of all registrations, permits, reports, inspections, enforcement activities, and financial data of all sites which are generators and/or treatment, storage, and disposal facilities of hazardous wastes regulated under the RCRA. The RCRA Treatment Storage or Disposal (TSD) is a subset of the RCRIS list. The standard search radius for TSD facilities is one-half ($\frac{1}{2}$) mile.

- No RCRA TSD findings were reported within the search area.

RCRA GEN: Database of facilities that generate or transport hazardous wastes or meet other RCRA requirements such as Large Quantity Generators (LQG), Small Quantity Generators (SQG), Conditionally Exempt Small Quantity Generator (CESQG). Included are RCRA Administrative Action Tracking System (RAATS) and Compliance Monitoring & Enforcement List (CMEL) facilities. The standard search for RCRA Generators (GEN) facilities is for the SITE and adjacent properties.

- No RCRA GEN findings were reported within the search area.

Federal Institutional Control/Engineering Controls: The Federal Institutional Control/Engineering Control (IC/EC) is a database for Superfund sites that have either engineering or an institutional control placed on the property. The data includes the control and the media contaminated. The standard search for Federal IC/EC sites is for the SITE only.

- No Federal IC/EC findings were reported for the SITE.

Federal Brownfield: A listing of Federal Brownfield (FED BWN) sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that are either abandoned or underutilized where

redevelopment or expansion is complicated by real or perceived environmental contamination. The approximate minimum search distance for FED BWN sites is one-half ($\frac{1}{2}$) mile.

- No Federal Brownfield findings were reported within the search area.

ERNS: The Federal "Emergency Response Notification System" (ERNS) documents sites or facilities that have been reported as areas subjected to or impacted by spills or discharges of hazardous substances. The standard search for ERNS facilities is for the SITE only.

- No ERNS findings were reported for the SITE.

State Databases:

State/Tribal Sites (NPL): This State/Tribal Sites is a TCEQ database listing of sites contained in the State Superfund Registry. The standard search radius for State/Tribal Sites is one (1) mile.

- No State/Tribal NPL Site findings were reported within the search area.

State/Tribal Disposal or Landfill (SWL): Solid Waste Landfills (SWL) maintained by the TCEQ Municipal Solid Waste Landfill (MSWLF) Registration and Permit Database serves to track permits and registration for landfills, transfer stations, sludge application sites, illegal dumping sites, recycling facilities, medical generators and transporters. The standard search radius for SWL facilities is one-half ($\frac{1}{2}$) mile.

- No State/Tribal SWL findings were reported within the search area.

State/Tribal Leaking PST: The Leaking Petroleum Storage Tank (LPST) List is maintained by the TCEQ under the LPST Program. The standard search radius for LPST sites is one-half ($\frac{1}{2}$) mile.

- One State/Tribal Leaking PST findings was reported within a one-quarter ($\frac{1}{4}$) mile radius of the SITE.

South Texas Concrete, LPST ID# 114780, located at 1420 S. 28th Street and 1420 S. 26th Street, approximately 0.12 miles west of the SITE. According to TCEQ records, three 1,000-gallon underground ground storage tanks (USTs) for gasoline and diesel fuel storage were installed on January 1, 1984 and were removed in 1999. The leak discovery date was September 26, 1999 with groundwater impacted and no apparent threats or impacts to receptors. This facility has been issued final concurrence and the case is closed.

Based on the information reviewed for this finding, including non-adjacent location, it is **RKEI's** opinion that impact to the SITE from the reported facility is unlikely.

State/Tribal Storage Tanks (UST/AST): Underground and aboveground storage tanks (USTs/ASTs) are tracked by the TCEQ under the Petroleum Storage Tank (PST) Program. The standard search for PST facilities is for the SITE and adjacent properties.

- One State/Tribal Storage PST findings were reported for a SITE adjacent property:

South Texas Concrete, Facility ID# 0029482, 0078610, 0078815, located at 1420 S. 28th Street and 1420 S. 26th Street, approximately 0.12 miles west of the SITE. This facility is identified as a location where three 1,000-gallon USTs for gasoline/diesel use were installed in 1984 but have been removed from the ground in 1999. This facility has five ASTs exist at this location; 1-4,000-gallon (gasoline), 1-10,000-gallon (diesel), 1-9,200-gallon (diesel), 1-11,722-gallon (diesel), and 1-722-gallon (diesel). This facility is also referenced in the preceding LSPT section.

Based on the information reviewed for this finding, it is **RKEI's** opinion that impact to the SITE from the reported facility is unlikely.

State/Tribal VCP: Listing of all sites in the Voluntary Cleanup Program (VCP) and Innocent Owner/Operator Program (IOP). Some VCP and IOP sites are noted as having institutional controls placed on the property. The standard search radius for State/Tribal VCP sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal VCP findings were reported within the search area.

State/Tribal Engineering Controls (EC): TCEQ database listing in the VCP and IOP where engineering controls have been placed on the property. The standard search for State/Tribal EC sites is for the SITE only.

- No State/Tribal EC findings were reported for the SITE.

State/Tribal Institutional Controls (IC): TCEQ database listing in the VCP and IOP where institutional controls have been placed on the property. The standard search for State/Tribal IC sites is for the SITE only.

- No State/Tribal IC findings were reported for the SITE.

State/Tribal Brownfields: Listing of all former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. Some sites are noted as having institutional controls placed on the property. The standard search radius for State/Tribal Brownfield sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal Brownfield findings were reported within the search area.

Industrial Hazardous Waste (IHW): This database includes Texas Industrial Hazardous Waste Notice of Registration (IHW NOR) data. The TCEQ enters all information submitted by industrial and hazardous waste transporters, receivers (including recyclers), generators and one time shipments into a database that tracks industrial and hazardous waste generation and management activities in the State of Texas. All facilities of these types receive a solid waste registration number. IHW facilities are searched for one-quarter ($\frac{1}{4}$) mile.

- Two State IHW sites were reported within the search area:

Ryder Pie Nationwide, EPA ID# FLD007922578, located at 1302 S. 28th Avenue, Ste A, approximately 0.12 miles northwest of the SITE. The facility is reported as active; with no corrective actions reported.

Holt Cat, EPA ID# TXR000002956, located at 1320 S. 25th Avenue, approximately 0.25 miles northwest of the SITE. The facility is reported as inactive facility with past solvent, grease and oil waste generated as a result of truck/heavy equipment operations/servicing. This facility does not have any reported corrective actions.

Based on the information reviewed for the reported findings, it is **RKEI's** opinion that impact to the SITE from the reported facilities is unlikely.

Non-ASTM/AAI Required Databases:

RCRA: This database lists all sites that fall under the RCRA and are not classified as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action requirements. RCRA facilities are searched for one-quarter (¼) mile.

- One RCRA facility was identified within the search area:

Holt Cat, EPA ID# TXR000002956, located at 1320 S. 25th Avenue, approximately 0.25 miles northwest of the SITE. The facility is reported as inactive facility with past solvent, grease and oil waste generated as a result of truck/heavy equipment operations/servicing. This facility is a verified non-generator.

Based on the information reviewed for the reported findings, it is **RKEI's** opinion that impact to the SITE from the reported facilities is unlikely.

Dry Cleaners (DRYC and DCRP): Dry Cleaner data houses both the Dry Cleaner Remediation Program (DCRP) and perchloroethylene (PERC) information released by the TCEQ. The DCRP database contains records funded for state-led cleanup of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. This database also lists active dry cleaning facilities and drop stations registered with the TCEQ as DRYC. The search radius for DCRP and DRYC facilities is one-quarter (¼) mile.

- No DRYC or DCRP findings were reported within the search area.

SITE NORTHWEST

Federal Databases:

NPL Report: The National Priority List (NPL) is a list of sites identified by the federal government as having a priority for cleanup. The NPL appears in the Code of Federal Regulations, CFR 40, Parts 190 to 399. The standard search radius for NPL sites is one (1) mile.

- No NPL findings were reported within the search area.

NPL Delisted: The National Priority List (NPL) Delisted consists of a database of delisted Superfund sites. The standard search radius for NPL Delisted sites is one-half ($\frac{1}{2}$) mile.

- No NPL Delisted findings were reported within the search area.

CERCLIS Report: The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Information System (CERCLIS) is compiled by the federal government and includes sites which could possibly be contaminated and may require cleanup. Many of the properties that appear on the CERCLIS List have not been thoroughly investigated. The standard search radius for CERCLA sites is one-half ($\frac{1}{2}$) mile.

- No CERCLIS findings were reported within the search area.

NFRAP Report: The No Further Remedial Action Planned (NFRAP) Report includes sites, which have been determined by the EPA, following preliminary assessment, to no longer pose a significant risk or require further activity under CERCLA. After initial investigation, no contamination was found, contamination was quickly removed or contamination was not serious enough to require Federal Superfund action or National Priorities List (NPL) consideration. The standard search radius for NFRAP sites is one-half ($\frac{1}{2}$) mile.

- No NFRAP findings were reported within the search area.

RCRA COR ACT: Corrective Action (COR ACT) lists Resource Conservation and Recovery Information System (RCRIS) Sites that are currently under corrective action. The standard search radius for COR ACT facilities is one (1) mile.

- No RCRA COR ACT findings were reported within the search area.

RCRA TSD: The RCRIS serves to track the status of all registrations, permits, reports, inspections, enforcement activities, and financial data of all sites which are generators and/or treatment, storage, and disposal facilities of hazardous wastes regulated under the RCRA. The RCRA Treatment Storage or Disposal (TSD) is a subset of the RCRIS list. The standard search radius for TSD facilities is one-half ($\frac{1}{2}$) mile.

- No RCRA TSD findings were reported within the search area.

RCRA GEN: Database of facilities that generate or transport hazardous wastes or meet other RCRA requirements such as Large Quantity Generators (LQG), Small Quantity Generators (SQG), Conditionally Exempt Small Quantity Generator (CESQG). Included are RCRA Administrative Action Tracking System (RAATS) and Compliance Monitoring & Enforcement List (CMEL) facilities. The standard search for RCRA Generators (GEN) facilities is for the SITE and adjacent properties.

- One RCRA GEN finding was reported for the SITE or adjacent properties.

BJ Services, EPA ID# TXD078485976, located at 825 FM 1925, approximately 0.24 miles east of the SITE. The facility is reported as small quantity generator for support of oil and gas operators. No

violations are reported for this facility. This facility is not currently reported as subject to any corrective actions.

Based on the information reviewed for this finding, it is **RKEI's** opinion that impact to the SITE from the reported facility is unlikely.

Federal Institutional Control/Engineering Controls: The Federal Institutional Control/Engineering Control (IC/EC) is a database for Superfund sites that have either engineering or an institutional control placed on the property. The data includes the control and the media contaminated. The standard search for Federal IC/EC sites is for the SITE only.

- No Federal IC/EC findings were reported for the SITE.

Federal Brownfield: A listing of Federal Brownfield (FED BWN) sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that are either abandoned or underutilized where redevelopment or expansion is complicated by real or perceived environmental contamination. The approximate minimum search distance for FED BWN sites is one-half ($\frac{1}{2}$) mile.

- No Federal Brownfield findings were reported within the search area.

ERNS: The Federal "Emergency Response Notification System" (ERNS) documents sites or facilities that have been reported as areas subjected to or impacted by spills or discharges of hazardous substances. The standard search for ERNS facilities is for the SITE only.

- No ERNS findings were reported for the SITE.

State Databases:

State/Tribal Sites (NPL): This State/Tribal Sites is a TCEQ database listing of sites contained in the State Superfund Registry. The standard search radius for State/Tribal Sites is one (1) mile.

- No State/Tribal Site findings were reported within the search area.

State/Tribal Disposal or Landfill (SWL): Solid Waste Landfills (SWL) maintained by the TCEQ Municipal Solid Waste Landfill (MSWLF) Registration and Permit Database serves to track permits and registration for landfills, transfer stations, sludge application sites, illegal dumping sites, recycling facilities, medical generators and transporters. The standard search radius for SWL facilities is one-half ($\frac{1}{2}$) mile.

- No State/Tribal SWL findings were reported within the search area.

State/Tribal Leaking PST: The Leaking Petroleum Storage Tank (LPST) List is maintained by the TCEQ under the LPST Program. The standard search radius for LPST sites is one-half ($\frac{1}{2}$) mile.

- Three State/Tribal Leaking PST findings were reported within a one-quarter ($\frac{1}{4}$) mile radius of the SITE. Of the three, two are reported as having received final concurrence and case closure from TCEQ for completed corrective actions. The following is an active facility:

Cantus Country Mart, LPST ID# 118732, located at 2202 W. Monte Cristo Road, 0.23 miles east of the SITE. According to TCEQ records, 1-8,000-gallon, 2-4,000-gallon underground ground storage tanks (USTs) that were installed on February 1993 and were removed in 2012. The leak discovery date was November 29, 2011 with groundwater impacted and no apparent threats or impacts to receptors. This facility also has 2-30260-gallon USTs used for the storage of gasoline that were installed on June 25, 2012. This facility is currently in the preassessment/release determination stage. No groundwater monitor wells were observed on or in the immediate vicinity of the facility.

Based on the information reviewed for this finding, including non-adjacent location, it is RKEI's opinion that impact to the SITE from the reported facilities is unlikely.

State/Tribal Storage Tanks (UST/AST): Underground and aboveground storage tanks (USTs/ASTs) are tracked by the TCEQ under the Petroleum Storage Tank (PST) Program. The standard search for PST facilities is for the SITE and adjacent properties.

- No State/Tribal Storage PST finding were reported for the SITE or adjacent properties.

State/Tribal VCP: Listing of all sites in the Voluntary Cleanup Program (VCP) and Innocent Owner/Operator Program (IOP). Some VCP and IOP sites are noted as having institutional controls placed on the property. The standard search radius for State/Tribal VCP sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal VCP findings were reported within the search area.

State/Tribal Engineering Controls (EC): TCEQ database listing in the VCP and IOP where engineering controls have been placed on the property. The standard search for State/Tribal EC sites is for the SITE only.

- No State/Tribal EC findings were reported for the SITE.

State/Tribal Institutional Controls (IC): TCEQ database listing in the VCP and IOP where institutional controls have been placed on the property. The standard search for State/Tribal IC sites is for the SITE only.

- No State/Tribal IC findings were reported for the SITE.

State/Tribal Brownfields: Listing of all former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. Some sites are noted as having institutional controls placed on the property. The standard search radius for State/Tribal Brownfield sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal Brownfield findings were reported within the search area.

Industrial Hazardous Waste (IHW): This database includes Texas Industrial Hazardous Waste Notice of Registration (IHW NOR) data. The TCEQ enters all information submitted by industrial and hazardous waste transporters, receivers (including recyclers), generators and one time shipments into a database that tracks industrial and hazardous waste generation and management activities in the State of Texas. All facilities of these types receive a solid waste registration number. IHW facilities are searched for one-quarter ($\frac{1}{4}$) mile.

- One State IHW site was reported within the search area.

BJ Services, EPA ID# TXD078485976, addressed at 825 FM 1925, approximately 0.24 miles east of the SITE. The facility is reported as an active location where oilfield service waste such as office refuse, scrap metal, truck lubricants/solvents, and wastewater are generated. No violations are reported for this facility. This facility is not reported as subject to any current corrective actions.

Based on the information reviewed for the reported finding, it is **RKEI's** opinion that impact to the SITE from the reported facility is unlikely.

Non-ASTM/AAI Required Databases:

RCRA: This database lists all sites that fall under the RCRA and are not classified as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action requirements. RCRA facilities are searched for one-quarter ($\frac{1}{4}$) mile.

- No RCRA facilities were identified within the search area.

Dry Cleaners (DRYC and DCRP): Dry Cleaner data houses both the Dry Cleaner Remediation Program (DCRP) and perchloroethylene (PERC) information released by the TCEQ. The DCRP database contains records funded for state-led cleanup of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. This database also lists active dry cleaning facilities and drop stations registered with the TCEQ as DRYC. The search radius for DCRP and DRYC facilities is one-quarter ($\frac{1}{4}$) mile.

- No DRYC or DCRP findings were reported within the search area.

SITE SOUTHWEST

Federal Databases:

NPL Report: The National Priority List (NPL) is a list of sites identified by the federal government as having a priority for cleanup. The NPL appears in the Code of Federal Regulations, CFR 40, Parts 190 to 399. The standard search radius for NPL sites is one (1) mile.

- No NPL findings were reported within the search area.

NPL Delisted: The National Priority List (NPL) Delisted consists of a database of delisted Superfund sites. The standard search radius for NPL Delisted sites is one-half ($\frac{1}{2}$) mile.

- No NPL Delisted findings were reported within the search area.

CERCLIS Report: The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Information System (CERCLIS) is compiled by the federal government and includes sites which could possibly be contaminated and may require cleanup. Many of the properties that appear on the CERCLIS List have not been thoroughly investigated. The standard search radius for CERCLA sites is one-half ($\frac{1}{2}$) mile.

- No CERCLIS findings were reported within the search area.

NFRAP Report: The No Further Remedial Action Planned (NFRAP) Report includes sites, which have been determined by the EPA, following preliminary assessment, to no longer pose a significant risk or require further activity under CERCLA. After initial investigation, no contamination was found, contamination was quickly removed or contamination was not serious enough to require Federal Superfund action or National Priorities List (NPL) consideration. The standard search radius for NFRAP sites is one-half ($\frac{1}{2}$) mile.

- No NFRAP findings were reported within the search area.

RCRA COR ACT: Corrective Action (COR ACT) lists Resource Conservation and Recovery Information System (RCRIS) Sites that are currently under corrective action. The standard search radius for COR ACT facilities is one (1) mile.

- No RCRA COR ACT findings were reported within the search area.

RCRA TSD: The RCRIS serves to track the status of all registrations, permits, reports, inspections, enforcement activities, and financial data of all sites which are generators and/or treatment, storage, and disposal facilities of hazardous wastes regulated under the RCRA. The RCRA Treatment Storage or Disposal (TSD) is a subset of the RCRIS list. The standard search radius for TSD facilities is one-half ($\frac{1}{2}$) mile.

- Two RCRA TSD findings were reported within the search area:

Mo-Vac Service Company Inc., EPA Handler ID# TXD006801369, located at 3721-A S. McColl Road, 0.20 miles south of the SITE. This facility is reported as a non-generator, not subject to any corrective actions.

Mo-Vac Environmental Inc., EPA Handler ID# TXR000014779, located at 3721 S. McColl Road, 0.20 miles south of the SITE. This facility is reported as a conditionally exempt small quantity generator of general freight trucking waste and is not subject to any corrective actions.

Based on the information reviewed for the findings, including non-adjacent locations, it is **RKEI's** opinion that impact to the SITE from the reported facilities is unlikely.

RCRA GEN: Database of facilities that generate or transport hazardous wastes or meet other RCRA requirements such as Large Quantity Generators (LQG), Small Quantity Generators (SQG), Conditionally Exempt Small Quantity Generator (CESQG). Included are RCRA Administrative Action Tracking System (RAATS) and Compliance Monitoring & Enforcement List (CMEL) facilities. The standard search for RCRA Generators (GEN) facilities is for the SITE and adjacent properties.

- Four RCRA GEN findings were reported within the search area.

1.50 Cleaners, EPA Handler ID# TX000074518, located at 2524 W. Freddy Gonzales Drive, 0.08 miles southwest of the SITE. This facility is reported as a conditionally exempt small quantity generator, not subject to any corrective actions.

Mo-Vac Environmental Inc., EPA Handler ID# TXR000014779, located at 3721 S. McColl Road, 0.20 miles south of the SITE. This facility is reported as a conditionally exempt small quantity generator of general freight trucking waste and is not subject to any current corrective actions.

CVS Pharmacy #4821, EPA Handler ID# TXR000081366, located at 2820 W. University Drive, 0.23 miles west of the SITE. This facility is reported as a conditionally exempt small quantity generator of general freight trucking waste and is not subject to any corrective actions.

One Hour Pronto Cleaners, EPA Handler ID# TXR000074534, located at 1106 S. Mccoll Rd., 0.23 miles west of the SITE. This facility is reported as a conditionally exempt small quantity generator of general freight trucking waste and is not subject to any corrective actions.

Based on the information reviewed for the findings, it is **RKEI's** opinion that impact to the SITE from the reported facilities is unlikely.

Federal Institutional Control/Engineering Controls: The Federal Institutional Control/Engineering Control (IC/EC) is a database for Superfund sites that have either engineering or an institutional control placed on the property. The data includes the control and the media contaminated. The standard search for Federal IC/EC sites is for the SITE only.

- No Federal IC/EC findings were reported for the SITE.

Federal Brownfield: A listing of Federal Brownfield (FED BWN) sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that are either abandoned or underutilized where redevelopment or expansion is complicated by real or perceived environmental contamination. The approximate minimum search distance for FED BWN sites is one-half ($\frac{1}{2}$) mile.

- No Federal Brownfield findings were reported within the search area.

ERNS: The Federal "Emergency Response Notification System" (ERNS) documents sites or facilities that have been reported as areas subjected to or impacted by spills or discharges of hazardous substances. The standard search for ERNS facilities is for the SITE only.

- No ERNS findings were reported for the SITE.

State Databases:

State/Tribal Sites (NPL): This State/Tribal Sites is a TCEQ database listing of sites contained in the State Superfund Registry. The standard search radius for State/Tribal Sites is one (1) mile.

- No State/Tribal Site findings were reported within the search area.

State/Tribal Disposal or Landfill (SWL): Solid Waste Landfills (SWL) maintained by the TCEQ Municipal Solid Waste Landfill (MSWLF) Registration and Permit Database serves to track permits and registration for landfills, transfer stations, sludge application sites, illegal dumping sites, recycling facilities, medical generators and transporters. The standard search radius for SWL facilities is one-half ($\frac{1}{2}$) mile.

- No State/Tribal SWL findings were reported within the search area.

State/Tribal Leaking PST: The Leaking Petroleum Storage Tank (LPST) List is maintained by the TCEQ under the LPST Program. The standard search radius for LPST sites is one-half ($\frac{1}{2}$) mile.

- Six State/Tribal Leaking PST findings were reported within a one-quarter ($\frac{1}{4}$) mile radius of the SITE. Of the six, four are reported as having received final concurrence and case closure from TCEQ for completed corrective actions. The following two are active facilities:

Economy Drive Inn FFP 290, LPST ID# 116761, located at 2015 S. McColl Road, 0.29 miles northwest of the SITE. This facility is reported as a location where a hydrocarbon released was discovered dating back to 2005. Groundwater was impacted however; no apparent threats or impacts to receptors were discovered. No groundwater monitor wells were observed on any immediate adjacent property indicating environmental concern for the SITE from this finding.

Fres Gas Depot, LPST ID# 110326, located at 2527 S. Hwy 281, 0.43 miles northeast of the SITE. According to TCEQ records, 2-8,000-gallon and 2-1,000-gallon underground ground storage tanks (USTs) that were installed in January 1977 and 4-1,000-gallon USTs were installed in August 1987. All of the USTs were removed in 2005. The leak discovery date was November 2004 with groundwater impacted and no apparent threats or impacts to receptors. This facility is currently awaiting final concurrence after documentation of well plugging. No groundwater monitor wells were observed on or in the immediate vicinity of the facility.

Based on the information reviewed for the findings, including non-adjacent locations, it is **RKEI's** opinion that impact to the SITE from the reported facilities is unlikely.

State/Tribal Storage Tanks (UST/AST): Underground and aboveground storage tanks (USTs/ASTs) are tracked by the TCEQ under the Petroleum Storage Tank (PST) Program. The standard search for PST facilities is for the SITE and adjacent properties.

- No State/Tribal Storage PST findings were reported for the SITE or adjacent properties.

State/Tribal VCP: Listing of all sites in the Voluntary Cleanup Program (VCP) and Innocent Owner/Operator Program (IOP). Some VCP and IOP sites are noted as having institutional controls placed on the property. The standard search radius for State/Tribal VCP sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal VCP findings were reported within the search area.

State/Tribal Engineering Controls (EC): TCEQ database listing in the VCP and IOP where engineering controls have been placed on the property. The standard search for State/Tribal EC sites is for the SITE only.

- No State/Tribal EC findings were reported for the SITE.

State/Tribal Institutional Controls (IC): TCEQ database listing in the VCP and IOP where institutional controls have been placed on the property. The standard search for State/Tribal IC sites is for the SITE only.

- No State/Tribal IC findings were reported for the SITE.

State/Tribal Brownfields: Listing of all former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. Some sites are noted as having institutional controls placed on the property. The standard search radius for State/Tribal Brownfield sites is one-half ($\frac{1}{2}$) mile.

- No State/Tribal Brownfield findings were reported within the search area.

Industrial Hazardous Waste (IHW): This database includes Texas Industrial Hazardous Waste Notice of Registration (IHW NOR) data. The TCEQ enters all information submitted by industrial and hazardous waste transporters, receivers (including recyclers), generators and one time shipments into a database that tracks industrial and hazardous waste generation and management activities in the State of Texas. All facilities of these types receive a solid waste registration number. IHW facilities are searched for one-quarter ($\frac{1}{4}$) mile.

- Two State IHW sites were reported within the search area. Of them, a non-adjacent facility is reported as inactive. The following facility is reported as active:

Mo-Vac Environmental, EPA Handler ID# TXR000014779, located at 3721 S. McColl Road, 0.20 miles south of the SITE. This facility is reported as an active generator of the cleanup of oil based mud materials. The facility is not reported subject to any corrective actions.

Based on the information reviewed for the findings, including non-adjacent locations, it is **RKEI's** opinion that impact to the SITE from the reported facilities is unlikely.

Non-ASTM/AAI Required Databases:

RCRA: This database lists all sites that fall under the RCRA and are not classified as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action requirements. RCRA facilities are searched for one-quarter ($\frac{1}{4}$) mile.

- One RCRA facility was identified within the search area:

Mo-Vac Environmental, EPA Handler ID# TXD988062378, located at 3721 S. McColl Road, 0.20 miles south of the SITE. This facility is reported as a past generator of benzene waste materials. This facility is currently reported as a verified non-generator and is not subject to any corrective actions.

Based on the information reviewed for the finding, including non-adjacent location, it is **RKEI's** opinion that impact to the SITE from the reported facility is unlikely.

Dry Cleaners (DRYC and DCRP): Dry Cleaner data houses both the Dry Cleaner Remediation Program (DCRP) and perchloroethylene (PERC) information released by the TCEQ. The DCRP database contains records funded for state-led cleanup of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. This database also lists active dry cleaning facilities and drop stations registered with the TCEQ as DRYC. The search radius for DCRP and DRYC facilities is one-quarter (¼) mile.

- Two DRYC or DCRP findings were reported within the search area.

1.50 Cleaners, Registration ID# RN104094453, located at 2524 W. Freddy Gonzalez Dr., 0.08 miles southwest of the SITE. This facility is reported as an active drop station. This facility is currently not reported subject to any corrective actions.

Oasis One Dry Cleaners, Registration ID# RN104094594, located at 1106 S. McColl Rd., 0.23 miles west of the SITE. This facility is reported as an active drop station and facility. This facility is currently not reported subject to any corrective actions.

Based on the information reviewed for the findings, including non-adjacent locations, it is **RKEI's** opinion that impact to the SITE from the reported facilities is unlikely.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

During the course of this ESA-I, **RKEI** supplemented the standard environmental record sources by reviewing reasonably ascertainable records pertaining to the SITE and adjacent properties:

Closed Landfills: According to a January 28, 2014 review of the Lower Rio Grande Valley Development Council's *Inventory of Closed Landfills*, no permitted and/or unpermitted landfills are identified on or immediately adjacent to the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Groundwater Wells: According to a January 28, 2014 review of the Texas Water Development Board's *Water Information Integration and Dissemination* website via <http://wiid.twdb.state.tx.us>, no groundwater wells are mapped at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Oil Well, Gas Wells, and Pipelines: According to a January 28, 2014 review of the Texas Railroad Commission map records available online via <http://gis2.rrc.state.tx.us/public/>, no gas or oil wells or pipelines are mapped at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

PREVIOUS ENVIRONMENTAL REPORTS

No previous environmental reports were identified or provided to **RKEI** during the course of this assessment.

SITE RECONNAISSANCE

The objective of the site reconnaissance is to obtain information indicating the likelihood of identifying *recognized environmental conditions* in connection with the SITE.

METHODOLOGY AND LIMITING CONDITIONS

Tomas Cruz of **RKEI** performed the SITE reconnaissance on January 24, 2014. The SITE and its perimeter were traversed by foot and the surrounding area of reconnaissance was observed from a vehicle.

RKEI did not encounter SITE access limitations imposed by physical obstructions, such as adjacent buildings, bodies of water, asphalt or other paved areas, and limiting conditions (e.g., adverse weather conditions).

GENERAL SITE SETTING

Sewage Disposal System

No sewage disposal systems were observed at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Surface Stormwater Drainage

Surface stormwater occurring at the SITE Northeast, Southeast, Northwest and Southwest outfall locations appeared to drain into associated drainage ditch features.

Potable Water Supply

RKEI observed no potable water supply system associated with the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Surface Water

Other than standing water located in the earthen drainage ditch features associated with SITE Northeast, Southeast, Northwest and Southwest outfall locations, **RKEI** observed no creeks, streams or surface water impoundments at the SITE.

Underground and Above Ground Storage Tanks (UST/AST)

RKEI observed no USTs or ASTs at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Odors

No strong, pungent, or noxious odors were identified at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Pools of Liquid

No pools of liquid were noted at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Drums

RKEI observed no drums of regulated substances at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Hazardous Substance and Petroleum Products Containers

RKEI observed no hazardous substance or petroleum product containers at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Known or Observed Usage of Hazardous Substances

No known or observed usage of hazardous substances was identified at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Unidentified Substance Containers

RKEI observed no unidentified substance containers on or about the SITE Northeast, Southeast, Northwest and Southwest outfall locations during the reconnaissance.

Polychlorinated Biphenyls (PCBs)

Electrical transformers are a potential source of environmental concern due to the potential presence of polychlorinated biphenyls (PCBs) contained in dielectric fluids used in some units. No such equipment was observed at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Potential for Offsite Migration of Hazardous Materials or Petroleum Products

RKEI observed no visual or documented evidence of migration of hazardous substances or petroleum hydrocarbons onto or from the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

INTERIOR OBSERVATIONS

Structures are not located at the SITE Northeast, Southeast, Northwest and Southwest outfall locations. Therefore, heating and cooling, stains and corrosions, and drains and sumps were not addressed pursuant to ASTM E 1527-05 §9.4.3.

EXTERIOR OBSERVATIONS

Pits, Ponds, or Lagoons

No evidence of pits, ponds, or lagoons was observed or identified in connection with waste disposal or waste treatment at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Stained Soils or Stressed Vegetation

No evidence of stained soils or stressed vegetation as a result of a release of hazardous materials and/or petroleum products was observed at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Solid Waste Disposal

No evidence of solid waste disposal, storage, or generation, or areas apparently filled or graded by non-natural causes suggesting solid waste disposal was observed at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Process Wastewater

Process wastewater is not generated at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Wells

No groundwater, environmental monitoring, oil, or gas wells were observed at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

One well was observed located to northwest of SITE Southwest outfall location #1. According to a January 28, 2014 review of the Texas Railroad Commission map records available online via <http://gis2.rrc.state.tx.us/public/>, the well is a plugged natural gas well. No groundwater monitor wells were observed on any immediate adjacent outfall location grounds indicating environmental concern for the SITE from this finding.

Septic Systems

RKEI neither observed nor identified any septic systems or cesspools at the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

Site Plan

A Site Plan is presented in ***Figure 3***.

INTERVIEWS

The objective of interviews is to obtain information indicating *recognized environmental conditions* in connection with the SITE.

INTERVIEW WITH OWNER

During the course of this assessment a SITE owner interview for the purpose of obtaining historical property information was not reasonably ascertainable.

INTERVIEW WITH LOCAL GOVERNMENT OFFICIALS

The City of Edinburg Fire Department (EFD) was contacted by online public information request on January 21, 2014 to determine if the SITE has been subject to any emergency incident response activity such as hazardous materials spills. No records were identified indicating environmental conditions or incident response such as chemical spills or releases, chemical storage, underground storage tanks, leaking underground storage tanks.

RKEI contacted the TCEQ Open Records & Reporting Services – Information Resources Division on January 21, 2014 to determine if the agency has information related to potential environmental impacts occurring on the SITE. However, as of this reporting a response from TCEQ has not been received.

FINDINGS AND OPINIONS

- The SITE was observed as 16 earthen drainage ditch outfall locations in Northeast, Southeast, Northwest and Southwest sectors of the City of Edinburg, Hidalgo County, Texas. Based on CLIENT provided outfall mapping data, concrete outfall piping was observed at 15 locations with one likely a proposed location for outfall piping installations. The SITE Northeast, Southeast, Northwest and Southwest outfall locations are accessible primarily via private, gated drainage ditch right-of-ways.
- During SITE reconnaissance activities, **RKEI** observed no evidence of the following: bulk storage of hazardous materials and/or petroleum products in underground or aboveground storage tanks (USTs/ASTs); process wastewater generation; oil or gas wells; hazardous material usage; stained soils or stressed vegetation; suspect polychlorinated biphenyls (PCBs) or other features that would suggest potential *recognized environmental conditions* associated with the SITE.
- Current use of SITE Northeast, Southeast, Northwest and Southwest adjacent properties includes a combination of vacant/undeveloped land, cultivated farmland, citrus crop farmland, native brushland, public thoroughfares, single-family residential development, multi-family residential development, commercial, church and school developments. Field observations indicated no readily observable *recognized environmental conditions* in connection with the adjacent properties.
- **RKEI** reviewed available historical aerial photography dated 1939, 1955, 1961, 1977, 1980, 1995, 2004, 2008 and 2012 to determine historical use of the SITE Northeast, Southeast, Northwest and Southwest outfall locations. Throughout the aerial photographs the SITE locations are depicted as vacant/undeveloped land until 1980 with increased development into drainage ditch and outfall locations after 1980. Throughout the aerial photographs adjacent properties are depicted generally as vacant/undeveloped land, farmland and public thoroughfares, single-family residential development, multi-family residential development, commercial, church and school developments, as observed during recent SITE reconnaissance activities. No imagery suggesting adverse environmental conditions (i.e., heavy industrial, landfill usage) for the SITE Northeast, Southeast, Northwest and Southwest outfall locations, or adjacent properties was discerned in review of the referenced historical aerial photographs.
- A search of federal (U.S. Environmental Protection Agency) and state (Texas Commission on Environmental Quality [TCEQ]) regulatory databases revealed forty-four (44) regulated facilities within the standard search radius of the SITE Northeast, Southeast, Northwest and Southwest outfall locations, as defined by the ASTM Standard E 1527-05. However, based on regulatory database information reviewed, none of the findings are considered environmental concerns to the SITE Northeast, Southeast, Northwest and Southwest outfall locations.
- Based on the information reviewed, there was no evidence that the subject or adjacent properties are currently under federal or state environmental enforcement action. The SITE reconnaissance, regulatory database review, and historical review, revealed no evidence to suggest that there are any potential environmental concerns associated with the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

CONCLUSIONS

RKEI has performed a Phase I Environmental Site Assessment for 16 Outfall Locations designated as four City sectors located throughout the City of Edinburg, Hidalgo County, Texas; the SITE Northeast, Southeast, Northwest and Southwest. A SITE Constraints Map is also included in this ESA-I. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

RECOMMENDATIONS

Based on the information developed as the result of this ESA-I, no further environmental assessment activities are recommended for the SITE Northeast, Southeast, Northwest and Southwest outfall locations.

DATA GAPS

A data gap is a lack of or inability to obtain information required by this ESA-I practice despite good faith efforts by the Environmental Professional to gather such information.

- Past and/or present SITE owner interviews were not *reasonably ascertainable* during this ESA-I process.

ADDITIONAL SERVICES

Additional services (i.e., asbestos, mold, lead-based paint, etc.) per ASTM Standard E 1527-05 §13.1.5 are considered non-scope considerations and were not addressed as part of this ESA-I.

A Constraints Map was created to illustrate, manage, analyze, and visualize geographically-referenced information with respect to the 16 outfall locations. The Constraints Map illustrates threatened and Endangered Species Habitat, Occurrences, or Designated Critical Habitat Areas, Surface Water and Groundwater Resources, Riparian Areas, Floodplains, Archeological Sites with respect to the 16 outfall locations. The Constraints Map can be found in **Attachment D**.

ENVIRONMENTAL PROFESSIONAL STATEMENT

We declare that, to best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312 and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the SITE. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in CFR Part 312.

PROFESSIONAL QUALIFICATIONS AND SIGNATURE PAGE

RKEI is a multi-disciplined engineering and consulting firm with over twenty years of experience in the areas of environmental assessments, environmental audits, hazardous waste site restoration, environmental compliance and permitting, geological assessments, geotechnical evaluations, petroleum storage tank site monitoring and remediation, and wastewater monitoring. **RKEI** has been involved with thousands of environmental assessments and remediation projects throughout Texas.

Tomas Cruz was the Environmental Professional that performed this ESA-I. Mr. Cruz has over thirteen years of direct experience in conducting, managing, and coordinating subsurface soil and groundwater investigations, landfill monitoring, landfill liner construction, risk-based assessments, indoor air quality and lead-based paint surveys and has performed over 300 environmental site assessments. Callie Bletsch provided peer review for this ESA-I. Ms. Bletsch has more than 6 years in the environmental consulting field with an emphasis on environmental assessments and permitting. She received a Bachelor's and Masters of Science in Environmental Engineering in May of 2000.

The Environmental Professionals that performed this ESA-I represent that, to the best of their knowledge, the statements and facts in this ESA-I are true and correct and, to the best of the assessor's knowledge, no material facts have been suppressed or misstated.

Soils TWDB Master Drainage Plan - SE(1)
Soils Types Found

Target Property	28
Within 0.1 miles of Target Property	28, 31

Soil Type Descriptions**28 - Hidalgo sandy clay loam, 0 to 1 percent slopes**

Hydric Status	0
---------------	---

Minimum Depth to Bedrock**Hidalgo (80 percent)**

Hydrologic Group	Moderately low runoff potential
------------------	---------------------------------

Soil Drainage Class	Well drained
---------------------	--------------

Corrosion Potential - Uncoated Steel	High
--------------------------------------	------

Depth to Restrictive Feature

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Sandy clay loam	0 cm	43 cm	A-6	CL, SC
H2	Sandy clay loam	43 cm	71 cm	A-6	CL, SC
H3	Sandy clay loam	71 cm	203 cm	A-6, A-7-6	CL, SC

Unnamed, minor components (20 percent)**31 - Hidalgo-Urban land complex, 0 to 3 percent slopes**

Hydric Status	0
---------------	---

Minimum Depth to Bedrock**Hidalgo (50 percent)**

Hydrologic Group	Moderately low runoff potential
------------------	---------------------------------

Soil Drainage Class	Well drained
---------------------	--------------

Corrosion Potential - Uncoated Steel	High
--------------------------------------	------

Depth to Restrictive Feature

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Fine sandy loam	0 cm	43 cm	A-4, A-6	SC, SC-SM, SM
H2	Sandy clay loam	43 cm	71 cm	A-6	CL, SC
H3	Sandy clay loam	71 cm	203 cm	A-6, A-7-6	CL, SC

Urban land (30 percent)

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Variable	0 cm	102 cm		

Unnamed, minor components (20 percent)

Soils Descriptions TWDB Master Drainage Plan - SE(1)**AASHTO Classification Definitions**

A-1, A-1-a, A-1-b	Granular materials (35% or less passing No. 200 sieve), silt fragments, gravel and sand
A-2, A-2-4, A-2-5, A-2-6, A-2-7	Granular materials (35% or less passing No. 200 sieve), silty or clayey gravel and sand
A-3	Granular materials (35% or less passing No. 200 sieve), fine sand
A-4	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-5	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-7, A-7-5, A-7-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-8	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils

Unified Classification Definitions

CH	Fine-grained soils, silts and clays (liquid limit is 50% or more), Fat Clay
CL, CL-A (proposed), CL-K (proposed), CL-ML, CL-O (proposed), CL-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Lean Clay
GC, GC-GM	Coarse-grained soils, Gravels, gravel with fines, Clayey Gravel
GM	Coarse-grained soils, Gravels, gravel with fines, Silty Gravel
GP, GP-GC, GP-GM	Coarse-grained soils, Gravels, clean gravels, Poorly Graded Gravel
GW, GW-GC, GW-GM	Coarse-grained soils, Gravels, clean gravels, Well-Graded Gravel
MH, MH-A, MH-K, MH-O, MH-T	Fine-grained soils, silts and clays (liquid limit is 50% or more), Elastic Silt
ML, ML-A (proposed), ML-K (proposed), ML-O (proposed), ML-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Silt
OH, OH-T (proposed)	Fine-grained soils, silts and clays (liquid limit is 50% or more), Organic Clay or Organic Silt
OL	Fine-grained soils, silts and clays (liquid limit is less than 50%), Organic Clay or Organic Silt
PT	Highly organic soils, Peat
SC, SC-SM	Coarse-grained soils, Sands, sands with fines, Clayey Sand
SM	Coarse-grained soils, Sands, sands with fines, Silty Sand
SP, SP-SC, SP-SM	Coarse-grained soils, Sands, clean sands, Poorly Graded Sand
SW, SW-SC, SW-SM	Coarse-grained soils, Sands, clean sands, Well-Graded Sand

This well scan searched for state and federal wells currently digitized in our geospatial database. No wells were found, but more wells could exist within the search area.

Source

U.S. Geological Survey, Texas Water Development Board (GW and Submitted Driller's Report), Texas Commission of Environmental Quality (PWS), Railroad Commission of Texas (Production Data)

Disclaimer

This well scan from Banks Environmental Data, Inc. has included a digital search of state and federal wells currently digitized in our geospatial database. Since this scan includes only well data that is currently mapped in our geospatial database, more wells could exist within the search area. For a complete well search or to locate more details, please contact Banks to obtain a full Water Well Report or Oil & Gas Well/Pipeline Search Report. More detailed individual well records can also be obtained from Banks for an additional cost, please reference a Well ID # from this well scan.

All well locations are based on information obtained from state and federal sources. Although Banks performs quality assurance and quality control on all data, inaccuracies of the records and mapped locations could possibly be traced to the specific regulatory authority or individual well driller. Banks Environmental Data, Inc. cannot fully guarantee the accuracy of the data or well location(s) of the maps and records maintained by the state and federal agencies.

Dataset Descriptions and Sources TWDB Master Drainage Plan - SE(1)

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
NPL -- National Priority List	EPA	NPL is the list of high priority hazardous waste sites in the United States eligible for long-term remedial action financed under the federal Superfund program and CERCLIS. Also known as Superfund sites, the EPA will only add sites to the NPL list based upon completion of the Hazard Ranking System (HRS) screening, public solicitation of comments about the proposed site, and after all comments have been addressed.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
DNPL -- Delisted National Priority List	EPA	DNPL is a list of all sites that have been deleted from the EPA NPL list. These sites are taken off the NPL list usually due to no further response or remedial action being required on them. Notices to delete NPL sites are published in the Federal Register and become effective unless the EPA receives significant adverse or critical comments during the 30-day public comment period.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER -- CERCLIS	EPA	CERCLIS sites come from the Comprehensive Environmental Response, Compensation, and Liability Act, a federal law designed to clean up abandoned hazardous waste sites. These sites are either proposed, listed or under review currently to be a part of the National Priority List.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER NFRAP -- CERCLIS NFRAP	EPA	CERCLIS sites designated 'No Further Remedial Action Planned' NFRAP have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the site being placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
RCRA COR -- RCRA CORRACTS	EPA	These sites are registered hazardous waste generators or handlers that fall under the Resource Conservation and Recovery Act (RCRA). and subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA TSD -- RCRA non-CORRACTS TSD	EPA	This database lists all treatment, storage and disposal of hazardous material sites that fall under the Resource Conservation and Recovery Act (RCRA). All hazardous waste TSD facilities are required to notify EPA of their existence.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA GEN -- RCRA Generators	EPA	The EPA regulates all Hazardous Waste Generators subject to the Resource Conservation and Recovery Act (RCRA). They are classified by the quantity of hazardous waste generated. A Small Quantity Generator (SQG) generates between 100kg and 1,000 kg of waste per month. A Large Quantity Generator (LQG) generates over 1,000 kg of waste per month. A Conditionally Exempt SQG (CEG) generates less than 100 kg of waste per month.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
FED BWN -- Federal Brownfields	EPA	A listing of sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that is either abandoned or underutilized where redevelopment or expansion is complicated by real or perceived environmental contamination.	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED IC -- Federal Institutional Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use. ICs are meant to supplement Engineering Controls and will rarely be the sole remedy at a site. ICs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED EC -- Federal Engineering Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination. ECs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - SE(1)

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
ERNS -- ERNS List	EPA/National Response Center	ERNS is a national database used to store information on unauthorized releases of oil and hazardous substances that have been reported to the National Response Center since 2001. The NRC is the sole federal point of contact for reporting oil and chemical spills. Prior to 2001 this information was maintained by the EPA.	Annually	01/11/2013	01/18/2013	01/18/2013	12/31/2012
ST NPL -- State/Tribal Equivalent NPL	TCEQ	This database contains sites determined by the TCEQ that may constitute an imminent and substantial endangerment to public health and safety or to the environment due to a release or threatened release of hazardous substances into the environment.	Quarterly	11/05/2013	11/06/2013	11/06/2013	11/06/2013
ST CER -- State/Tribal Equivalent CERCLIS	NA	This database is not currently available from this state. If this state does make this database available in the future, Banks Environmental Data will obtain it for reporting purposes.	NA	N/A	N/A	N/A	N/A
SWLF -- State/Tribal Disposal or Landfill	TCEQ	The SWLF database contains records of municipal solid waste facilities that may accept various types of municipal solid waste for processing or disposal, depending on the type of facility. A Municipal Solid Waste facility may also accept certain special wastes and non-hazardous industrial solid wastes if approved by the TCEQ executive director.	Quarterly	01/07/2014	01/07/2014	01/07/2014	01/03/2014
SWLF -- State/Tribal Disposal or Landfill	TCEQ	This database is a listing of closed and abandoned municipal solid waste landfills. The sites included are either unauthorized (UNUM_) or permitted (PERMAPP_).	NA	N/A	N/A	N/A	N/A
LPST -- State/Tribal Leaking Storage Tank	TCEQ	This database contains information on leaking storage tanks, equipment failures, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
LPST -- State/Tribal Leaking Storage Tank	EPA	The Tribal LUST database (maintained by EPA Region 6) provides information on leaking underground storage tank on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
PST -- State/Tribal Storage Tank	TCEQ	This database contains information on above and underground storage tanks, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
PST -- State/Tribal Storage Tank	EPA	The Tribal UST database (maintained by EPA Region 6) provides underground storage tank information on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
ST IC -- State/Tribal Institutional Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
ST IC -- State/Tribal Institutional Control	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST EC -- State/Tribal Engineering Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - SE(1)

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
VCP -- State/Tribal Voluntary Cleanup	TCEQ	This database contains sites from both the Voluntary Cleanup Program (VCP) and the Innocent Operator Program (IOP). The VCP records contain information on contaminated sites that private parties have cleaned up through assistance from the State in the form of administrative, technical, and legal incentives. The IOP records are sites that have received certificates from the State acknowledging that their property is contaminated as a result of a release or migration of contaminants from a source or sources not located on the property, and they did not cause or contribute to the source or sources of contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
VCP -- State/Tribal Voluntary Cleanup	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST BWN -- State/Tribal Brownfield	TCEQ	Brownfield sites are former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. In Texas, the TCEQ, in close partnership with the EPA and other federal, state, and local redevelopment agencies, and stakeholders, is facilitating cleanup, transferability, and revitalization of Brownfield's through the development of regulatory, tax, and technical assistance tools.	Quarterly	11/18/2013	11/18/2013	11/19/2013	11/04/2013
ST BWN -- State/Tribal Brownfield	RRC	The Railroad Commission of Texas' Voluntary Cleanup Program (RRC-VCP) provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination. Applicants to the program receive a release of liability to the state in exchange for a successful cleanup.	Quarterly	11/08/2013	11/13/2013	11/19/2013	11/13/2013
HW -- State/Tribal Hazardous Waste	TCEQ	This database contains information on facilities which store, process, or dispose of hazardous waste as maintained by the Industrial and Hazardous Waste Permits section of the TCEQ.	Quarterly	11/08/2013	11/13/2013	11/13/2013	10/05/2013
RCRA -- RCRA	EPA	This database lists all sites that fall under the Resource Conservation and Recovery Act (RCRA) and are not classifiable as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
DRYC -- Dry Cleaners	TCEQ	Dry Cleaner data houses both the DCRP Program information and PERC information released by the TCEQ. The DCRP database contains records funded for state-lead clean up of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. There are two listings from this program: LIST#1 - A historic listing of any facility that registered with the DCRP indicating whether or not the facility has used Perchloroethylene (PERC) in the past. LIST#2 - A Prioritization list of dry cleaner sites Facilities on this list will be investigated in order to determine the existence and/or extent of possible contamination. Facilities which are not current on their DCRP payments get dropped from the program. Banks Environmental Data DOES NOT REMOVE these listings from our database so that we may present a more complete historical listing of facilities that may or may not have used PERC in the past.	Quarterly	11/05/2013	11/06/2013	11/07/2013	11/06/2013

Disclaimer TWDB Master Drainage Plan - SE(1)

The Banks Environmental Data Regulatory Database Report was prepared based upon data obtained from State, Tribal, and Federal sources known to Banks Environmental Data at the time the data was obtained. Great care has been taken by Banks in obtaining the best available data from the best available sources. However, there is a possibility that there are sources of data applicable or pertaining to this report's target property, and/or surrounding properties, to which Banks does not have access or has not accessed. Furthermore, although Banks Environmental Data performs quality assurance and quality control on all data, including data it obtains, Banks recognizes that inaccuracies in data from these sources may, and do, exist; accordingly, inaccurate data may have been used or relied upon in the preparation of this report. Even though Banks Environmental Data performs a thorough and diligent search to locate and fix any inaccuracies in the data relied upon in the preparation of this report and this report, Banks cannot guarantee or warrant the accuracy of the locations, information, data, or report. The purchaser of this report accepts this report "as is" and assumes all risk related to any potential inaccuracy contained in the report or not reported in it, whether due to a reliance by Banks Environmental Data on inaccurate data, or for any other reason [including but not limited to the negligence or express negligence of Banks Environmental Data]. If this report is being used for the Records Review section of a Phase I Site Assessment according to the ASTM 1527-13, for EPA's All Appropriate Inquiry, or for any other purpose (public or private), all liability and responsibility is assumed by the Environmental Professional or other individual or entity acquiring the report.

Soils Descriptions TWDB Master Drainage Plan - NE**AASHTO Classification Definitions**

A-1, A-1-a, A-1-b	Granular materials (35% or less passing No. 200 sieve), silt fragments, gravel and sand
A-2, A-2-4, A-2-5, A-2-6, A-2-7	Granular materials (35% or less passing No. 200 sieve), silty or clayey gravel and sand
A-3	Granular materials (35% or less passing No. 200 sieve), fine sand
A-4	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-5	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-7, A-7-5, A-7-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-8	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils

Unified Classification Definitions

CH	Fine-grained soils, silts and clays (liquid limit is 50% or more), Fat Clay
CL, CL-A (proposed), CL-K (proposed), CL-ML, CL-O (proposed), CL-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Lean Clay
GC, GC-GM	Coarse-grained soils, Gravels, gravel with fines, Clayey Gravel
GM	Coarse-grained soils, Gravels, gravel with fines, Silty Gravel
GP, GP-GC, GP-GM	Coarse-grained soils, Gravels, clean gravels, Poorly Graded Gravel
GW, GW-GC, GW-GM	Coarse-grained soils, Gravels, clean gravels, Well-Graded Gravel
MH, MH-A, MH-K, MH-O, MH-T	Fine-grained soils, silts and clays (liquid limit is 50% or more), Elastic Silt
ML, ML-A (proposed), ML-K (proposed), ML-O (proposed), ML-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Silt
OH, OH-T (proposed)	Fine-grained soils, silts and clays (liquid limit is 50% or more), Organic Clay or Organic Silt
OL	Fine-grained soils, silts and clays (liquid limit is less than 50%), Organic Clay or Organic Silt
PT	Highly organic soils, Peat
SC, SC-SM	Coarse-grained soils, Sands, sands with fines, Clayey Sand
SM	Coarse-grained soils, Sands, sands with fines, Silty Sand
SP, SP-SC, SP-SM	Coarse-grained soils, Sands, clean sands, Poorly Graded Sand
SW, SW-SC, SW-SM	Coarse-grained soils, Sands, clean sands, Well-Graded Sand

This well scan searched for state and federal wells currently digitized in our geospatial database. No wells were found, but more wells could exist within the search area.

Source

U.S. Geological Survey, Texas Water Development Board (GW and Submitted Driller's Report), Texas Commission of Environmental Quality (PWS), Railroad Commission of Texas (Production Data)

Disclaimer

This well scan from Banks Environmental Data, Inc. has included a digital search of state and federal wells currently digitized in our geospatial database. Since this scan includes only well data that is currently mapped in our geospatial database, more wells could exist within the search area. For a complete well search or to locate more details, please contact Banks to obtain a full Water Well Report or Oil & Gas Well/Pipeline Search Report. More detailed individual well records can also be obtained from Banks for an additional cost, please reference a Well ID # from this well scan.

All well locations are based on information obtained from state and federal sources. Although Banks performs quality assurance and quality control on all data, inaccuracies of the records and mapped locations could possibly be traced to the specific regulatory authority or individual well driller. Banks Environmental Data, Inc. cannot fully guarantee the accuracy of the data or well location(s) of the maps and records maintained by the state and federal agencies.

Dataset Descriptions and Sources TWDB Master Drainage Plan - NE

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
NPL -- National Priority List	EPA	NPL is the list of high priority hazardous waste sites in the United States eligible for long-term remedial action financed under the federal Superfund program and CERCLIS. Also known as Superfund sites, the EPA will only add sites to the NPL list based upon completion of the Hazard Ranking System (HRS) screening, public solicitation of comments about the proposed site, and after all comments have been addressed.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
DNPL -- Delisted National Priority List	EPA	DNPL is a list of all sites that have been deleted from the EPA NPL list. These sites are taken off the NPL list usually due to no further response or remedial action being required on them. Notices to delete NPL sites are published in the Federal Register and become effective unless the EPA receives significant adverse or critical comments during the 30-day public comment period.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER -- CERCLIS	EPA	CERCLIS sites come from the Comprehensive Environmental Response, Compensation, and Liability Act, a federal law designed to clean up abandoned hazardous waste sites. These sites are either proposed, listed or under review currently to be a part of the National Priority List.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER NFRAP -- CERCLIS NFRAP	EPA	CERCLIS sites designated 'No Further Remedial Action Planned' NFRAP have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the site being placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
RCRA COR -- RCRA CORRACTS	EPA	These sites are registered hazardous waste generators or handlers that fall under the Resource Conservation and Recovery Act (RCRA). and subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA TSD -- RCRA non-CORRACTS TSD	EPA	This database lists all treatment, storage and disposal of hazardous material sites that fall under the Resource Conservation and Recovery Act (RCRA). All hazardous waste TSD facilities are required to notify EPA of their existence.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA GEN -- RCRA Generators	EPA	The EPA regulates all Hazardous Waste Generators subject to the Resource Conservation and Recovery Act (RCRA). They are classified by the quantity of hazardous waste generated. A Small Quantity Generator (SQG) generates between 100kg and 1,000 kg of waste per month. A Large Quantity Generator (LQG) generates over 1,000 kg of waste per month. A Conditionally Exempt SQG (CEG) generates less than 100 kg of waste per month.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
FED BWN -- Federal Brownfields	EPA	A listing of sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that is either abandoned or underutilized where redevelopment or expansion is complicated by real or perceived environmental contamination.	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED IC -- Federal Institutional Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use. ICs are meant to supplement Engineering Controls and will rarely be the sole remedy at a site. ICs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED EC -- Federal Engineering Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination. ECs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - NE

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
ERNS -- ERNS List	EPA/National Response Center	ERNS is a national database used to store information on unauthorized releases of oil and hazardous substances that have been reported to the National Response Center since 2001. The NRC is the sole federal point of contact for reporting oil and chemical spills. Prior to 2001 this information was maintained by the EPA.	Annually	01/11/2013	01/18/2013	01/18/2013	12/31/2012
ST NPL -- State/Tribal Equivalent NPL	TCEQ	This database contains sites determined by the TCEQ that may constitute an imminent and substantial endangerment to public health and safety or to the environment due to a release or threatened release of hazardous substances into the environment.	Quarterly	11/05/2013	11/06/2013	11/06/2013	11/06/2013
ST CER -- State/Tribal Equivalent CERCLIS	NA	This database is not currently available from this state. If this state does make this database available in the future, Banks Environmental Data will obtain it for reporting purposes.	NA	N/A	N/A	N/A	N/A
SWLF -- State/Tribal Disposal or Landfill	TCEQ	The SWLF database contains records of municipal solid waste facilities that may accept various types of municipal solid waste for processing or disposal, depending on the type of facility. A Municipal Solid Waste facility may also accept certain special wastes and non-hazardous industrial solid wastes if approved by the TCEQ executive director.	Quarterly	01/07/2014	01/07/2014	01/07/2014	01/03/2014
SWLF -- State/Tribal Disposal or Landfill	TCEQ	This database is a listing of closed and abandoned municipal solid waste landfills. The sites included are either unauthorized (UNUM_) or permitted (PERMAPP_).	NA	N/A	N/A	N/A	N/A
LPST -- State/Tribal Leaking Storage Tank	TCEQ	This database contains information on leaking storage tanks, equipment failures, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
LPST -- State/Tribal Leaking Storage Tank	EPA	The Tribal LUST database (maintained by EPA Region 6) provides information on leaking underground storage tank on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
PST -- State/Tribal Storage Tank	TCEQ	This database contains information on above and underground storage tanks, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
PST -- State/Tribal Storage Tank	EPA	The Tribal UST database (maintained by EPA Region 6) provides underground storage tank information on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
ST IC -- State/Tribal Institutional Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
ST IC -- State/Tribal Institutional Control	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST EC -- State/Tribal Engineering Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - NE

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
VCP -- State/Tribal Voluntary Cleanup	TCEQ	This database contains sites from both the Voluntary Cleanup Program (VCP) and the Innocent Operator Program (IOP). The VCP records contain information on contaminated sites that private parties have cleaned up through assistance from the State in the form of administrative, technical, and legal incentives. The IOP records are sites that have received certificates from the State acknowledging that their property is contaminated as a result of a release or migration of contaminants from a source or sources not located on the property, and they did not cause or contribute to the source or sources of contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
VCP -- State/Tribal Voluntary Cleanup	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST BWN -- State/Tribal Brownfield	TCEQ	Brownfield sites are former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. In Texas, the TCEQ, in close partnership with the EPA and other federal, state, and local redevelopment agencies, and stakeholders, is facilitating cleanup, transferability, and revitalization of Brownfield's through the development of regulatory, tax, and technical assistance tools.	Quarterly	11/18/2013	11/18/2013	11/19/2013	11/04/2013
ST BWN -- State/Tribal Brownfield	RRC	The Railroad Commission of Texas' Voluntary Cleanup Program (RRC-VCP) provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination. Applicants to the program receive a release of liability to the state in exchange for a successful cleanup.	Quarterly	11/08/2013	11/13/2013	11/19/2013	11/13/2013
HW -- State/Tribal Hazardous Waste	TCEQ	This database contains information on facilities which store, process, or dispose of hazardous waste as maintained by the Industrial and Hazardous Waste Permits section of the TCEQ.	Quarterly	11/08/2013	11/13/2013	11/13/2013	10/05/2013
RCRA -- RCRA	EPA	This database lists all sites that fall under the Resource Conservation and Recovery Act (RCRA) and are not classifiable as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
DRYC -- Dry Cleaners	TCEQ	Dry Cleaner data houses both the DCRP Program information and PERC information released by the TCEQ. The DCRP database contains records funded for state-lead clean up of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. There are two listings from this program: LIST#1 - A historic listing of any facility that registered with the DCRP indicating whether or not the facility has used Perchloroethylene (PERC) in the past. LIST#2 - A Prioritization list of dry cleaner sites Facilities on this list will be investigated in order to determine the existence and/or extent of possible contamination. Facilities which are not current on their DCRP payments get dropped from the program. Banks Environmental Data DOES NOT REMOVE these listings from our database so that we may present a more complete historical listing of facilities that may or may not have used PERC in the past.	Quarterly	11/05/2013	11/06/2013	11/07/2013	11/06/2013

Disclaimer TWDB Master Drainage Plan - NE

The Banks Environmental Data Regulatory Database Report was prepared based upon data obtained from State, Tribal, and Federal sources known to Banks Environmental Data at the time the data was obtained. Great care has been taken by Banks in obtaining the best available data from the best available sources. However, there is a possibility that there are sources of data applicable or pertaining to this report's target property, and/or surrounding properties, to which Banks does not have access or has not accessed. Furthermore, although Banks Environmental Data performs quality assurance and quality control on all data, including data it obtains, Banks recognizes that inaccuracies in data from these sources may, and do, exist; accordingly, inaccurate data may have been used or relied upon in the preparation of this report. Even though Banks Environmental Data performs a thorough and diligent search to locate and fix any inaccuracies in the data relied upon in the preparation of this report and this report, Banks cannot guarantee or warrant the accuracy of the locations, information, data, or report. The purchaser of this report accepts this report "as is" and assumes all risk related to any potential inaccuracy contained in the report or not reported in it, whether due to a reliance by Banks Environmental Data on inaccurate data, or for any other reason [including but not limited to the negligence or express negligence of Banks Environmental Data]. If this report is being used for the Records Review section of a Phase I Site Assessment according to the ASTM 1527-13, for EPA's All Appropriate Inquiry, or for any other purpose (public or private), all liability and responsibility is assumed by the Environmental Professional or other individual or entity acquiring the report.

Unnamed, minor components (5 percent)

Soils Descriptions TWDB Master Drainage Plan - NW**AASHTO Classification Definitions**

A-1, A-1-a, A-1-b	Granular materials (35% or less passing No. 200 sieve), silt fragments, gravel and sand
A-2, A-2-4, A-2-5, A-2-6, A-2-7	Granular materials (35% or less passing No. 200 sieve), silty or clayey gravel and sand
A-3	Granular materials (35% or less passing No. 200 sieve), fine sand
A-4	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-5	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-7, A-7-5, A-7-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-8	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils

Unified Classification Definitions

CH	Fine-grained soils, silts and clays (liquid limit is 50% or more), Fat Clay
CL, CL-A (proposed), CL-K (proposed), CL-ML, CL-O (proposed), CL-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Lean Clay
GC, GC-GM	Coarse-grained soils, Gravels, gravel with fines, Clayey Gravel
GM	Coarse-grained soils, Gravels, gravel with fines, Silty Gravel
GP, GP-GC, GP-GM	Coarse-grained soils, Gravels, clean gravels, Poorly Graded Gravel
GW, GW-GC, GW-GM	Coarse-grained soils, Gravels, clean gravels, Well-Graded Gravel
MH, MH-A, MH-K, MH-O, MH-T	Fine-grained soils, silts and clays (liquid limit is 50% or more), Elastic Silt
ML, ML-A (proposed), ML-K (proposed), ML-O (proposed), ML-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Silt
OH, OH-T (proposed)	Fine-grained soils, silts and clays (liquid limit is 50% or more), Organic Clay or Organic Silt
OL	Fine-grained soils, silts and clays (liquid limit is less than 50%), Organic Clay or Organic Silt
PT	Highly organic soils, Peat
SC, SC-SM	Coarse-grained soils, Sands, sands with fines, Clayey Sand
SM	Coarse-grained soils, Sands, sands with fines, Silty Sand
SP, SP-SC, SP-SM	Coarse-grained soils, Sands, clean sands, Poorly Graded Sand
SW, SW-SC, SW-SM	Coarse-grained soils, Sands, clean sands, Well-Graded Sand

Disclaimer

This well scan from Banks Environmental Data, Inc. has included a digital search of state and federal wells currently digitized in our geospatial database. Since this scan includes only well data that is currently mapped in our geospatial database, more wells could exist within the search area. For a complete well search or to locate more details, please contact Banks to obtain a full Water Well Report or Oil & Gas Well/Pipeline Search Report. More detailed individual well records can also be obtained from Banks for an additional cost, please reference a Well ID # from this well scan.

All well locations are based on information obtained from state and federal sources. Although Banks performs quality assurance and quality control on all data, inaccuracies of the records and mapped locations could possibly be traced to the specific regulatory authority or individual well driller. Banks Environmental Data, Inc. cannot fully guarantee the accuracy of the data or well location(s) of the maps and records maintained by the state and federal agencies.

Dataset Descriptions and Sources TWDB Master Drainage Plan - NW

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
NPL -- National Priority List	EPA	NPL is the list of high priority hazardous waste sites in the United States eligible for long-term remedial action financed under the federal Superfund program and CERCLIS. Also known as Superfund sites, the EPA will only add sites to the NPL list based upon completion of the Hazard Ranking System (HRS) screening, public solicitation of comments about the proposed site, and after all comments have been addressed.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
DNPL -- Delisted National Priority List	EPA	DNPL is a list of all sites that have been deleted from the EPA NPL list. These sites are taken off the NPL list usually due to no further response or remedial action being required on them. Notices to delete NPL sites are published in the Federal Register and become effective unless the EPA receives significant adverse or critical comments during the 30-day public comment period.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER -- CERCLIS	EPA	CERCLIS sites come from the Comprehensive Environmental Response, Compensation, and Liability Act, a federal law designed to clean up abandoned hazardous waste sites. These sites are either proposed, listed or under review currently to be a part of the National Priority List.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER NFRAP -- CERCLIS NFRAP	EPA	CERCLIS sites designated 'No Further Remedial Action Planned' NFRAP have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the site being placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
RCRA COR -- RCRA CORRACTS	EPA	These sites are registered hazardous waste generators or handlers that fall under the Resource Conservation and Recovery Act (RCRA). and subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA TSD -- RCRA non-CORRACTS TSD	EPA	This database lists all treatment, storage and disposal of hazardous material sites that fall under the Resource Conservation and Recovery Act (RCRA). All hazardous waste TSD facilities are required to notify EPA of their existence.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA GEN -- RCRA Generators	EPA	The EPA regulates all Hazardous Waste Generators subject to the Resource Conservation and Recovery Act (RCRA). They are classified by the quantity of hazardous waste generated. A Small Quantity Generator (SQG) generates between 100kg and 1,000 kg of waste per month. A Large Quantity Generator (LQG) generates over 1,000 kg of waste per month. A Conditionally Exempt SQG (CEG) generates less than 100 kg of waste per month.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
FED BWN -- Federal Brownfields	EPA	A listing of sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that is either abandoned or underutilized where redevelopment or expansion is complicated by real or perceived environmental contamination.	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED IC -- Federal Institutional Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use. ICs are meant to supplement Engineering Controls and will rarely be the sole remedy at a site. ICs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED EC -- Federal Engineering Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination. ECs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - NW

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
ERNS -- ERNS List	EPA/National Response Center	ERNS is a national database used to store information on unauthorized releases of oil and hazardous substances that have been reported to the National Response Center since 2001. The NRC is the sole federal point of contact for reporting oil and chemical spills. Prior to 2001 this information was maintained by the EPA.	Annually	01/11/2013	01/18/2013	01/18/2013	12/31/2012
ST NPL -- State/Tribal Equivalent NPL	TCEQ	This database contains sites determined by the TCEQ that may constitute an imminent and substantial endangerment to public health and safety or to the environment due to a release or threatened release of hazardous substances into the environment.	Quarterly	11/05/2013	11/06/2013	11/06/2013	11/06/2013
ST CER -- State/Tribal Equivalent CERCLIS	NA	This database is not currently available from this state. If this state does make this database available in the future, Banks Environmental Data will obtain it for reporting purposes.	NA	N/A	N/A	N/A	N/A
SWLF -- State/Tribal Disposal or Landfill	TCEQ	The SWLF database contains records of municipal solid waste facilities that may accept various types of municipal solid waste for processing or disposal, depending on the type of facility. A Municipal Solid Waste facility may also accept certain special wastes and non-hazardous industrial solid wastes if approved by the TCEQ executive director.	Quarterly	01/07/2014	01/07/2014	01/07/2014	01/03/2014
SWLF -- State/Tribal Disposal or Landfill	TCEQ	This database is a listing of closed and abandoned municipal solid waste landfills. The sites included are either unauthorized (UNUM_) or permitted (PERMAPP_).	NA	N/A	N/A	N/A	N/A
LPST -- State/Tribal Leaking Storage Tank	TCEQ	This database contains information on leaking storage tanks, equipment failures, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
LPST -- State/Tribal Leaking Storage Tank	EPA	The Tribal LUST database (maintained by EPA Region 6) provides information on leaking underground storage tank on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
PST -- State/Tribal Storage Tank	TCEQ	This database contains information on above and underground storage tanks, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
PST -- State/Tribal Storage Tank	EPA	The Tribal UST database (maintained by EPA Region 6) provides underground storage tank information on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
ST IC -- State/Tribal Institutional Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
ST IC -- State/Tribal Institutional Control	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST EC -- State/Tribal Engineering Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - NW

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
VCP -- State/Tribal Voluntary Cleanup	TCEQ	This database contains sites from both the Voluntary Cleanup Program (VCP) and the Innocent Operator Program (IOP). The VCP records contain information on contaminated sites that private parties have cleaned up through assistance from the State in the form of administrative, technical, and legal incentives. The IOP records are sites that have received certificates from the State acknowledging that their property is contaminated as a result of a release or migration of contaminants from a source or sources not located on the property, and they did not cause or contribute to the source or sources of contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
VCP -- State/Tribal Voluntary Cleanup	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST BWN -- State/Tribal Brownfield	TCEQ	Brownfield sites are former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. In Texas, the TCEQ, in close partnership with the EPA and other federal, state, and local redevelopment agencies, and stakeholders, is facilitating cleanup, transferability, and revitalization of Brownfield's through the development of regulatory, tax, and technical assistance tools.	Quarterly	11/18/2013	11/18/2013	11/19/2013	11/04/2013
ST BWN -- State/Tribal Brownfield	RRC	The Railroad Commission of Texas' Voluntary Cleanup Program (RRC-VCP) provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination. Applicants to the program receive a release of liability to the state in exchange for a successful cleanup.	Quarterly	11/08/2013	11/13/2013	11/19/2013	11/13/2013
HW -- State/Tribal Hazardous Waste	TCEQ	This database contains information on facilities which store, process, or dispose of hazardous waste as maintained by the Industrial and Hazardous Waste Permits section of the TCEQ.	Quarterly	11/08/2013	11/13/2013	11/13/2013	10/05/2013
RCRA -- RCRA	EPA	This database lists all sites that fall under the Resource Conservation and Recovery Act (RCRA) and are not classifiable as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
DRYC -- Dry Cleaners	TCEQ	Dry Cleaner data houses both the DCRP Program information and PERC information released by the TCEQ. The DCRP database contains records funded for state-lead clean up of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. There are two listings from this program: LIST#1 - A historic listing of any facility that registered with the DCRP indicating whether or not the facility has used Perchloroethylene (PERC) in the past. LIST#2 - A Prioritization list of dry cleaner sites Facilities on this list will be investigated in order to determine the existence and/or extent of possible contamination. Facilities which are not current on their DCRP payments get dropped from the program. Banks Environmental Data DOES NOT REMOVE these listings from our database so that we may present a more complete historical listing of facilities that may or may not have used PERC in the past.	Quarterly	11/05/2013	11/06/2013	11/07/2013	11/06/2013

Disclaimer TWDB Master Drainage Plan - NW

The Banks Environmental Data Regulatory Database Report was prepared based upon data obtained from State, Tribal, and Federal sources known to Banks Environmental Data at the time the data was obtained. Great care has been taken by Banks in obtaining the best available data from the best available sources. However, there is a possibility that there are sources of data applicable or pertaining to this report's target property, and/or surrounding properties, to which Banks does not have access or has not accessed. Furthermore, although Banks Environmental Data performs quality assurance and quality control on all data, including data it obtains, Banks recognizes that inaccuracies in data from these sources may, and do, exist; accordingly, inaccurate data may have been used or relied upon in the preparation of this report. Even though Banks Environmental Data performs a thorough and diligent search to locate and fix any inaccuracies in the data relied upon in the preparation of this report and this report, Banks cannot guarantee or warrant the accuracy of the locations, information, data, or report. The purchaser of this report accepts this report "as is" and assumes all risk related to any potential inaccuracy contained in the report or not reported in it, whether due to a reliance by Banks Environmental Data on inaccurate data, or for any other reason [including but not limited to the negligence or express negligence of Banks Environmental Data]. If this report is being used for the Records Review section of a Phase I Site Assessment according to the ASTM 1527-13, for EPA's All Appropriate Inquiry, or for any other purpose (public or private), all liability and responsibility is assumed by the Environmental Professional or other individual or entity acquiring the report.

Soils Types Found

Target Property	28
Within 0.1 miles of Target Property	28

Soil Type Descriptions**28 - Hidalgo sandy clay loam, 0 to 1 percent slopes**

Hydric Status	0
---------------	---

Minimum Depth to Bedrock**Hidalgo (80 percent)**

Hydrologic Group	Moderately low runoff potential
------------------	---------------------------------

Soil Drainage Class	Well drained
---------------------	--------------

Corrosion Potential - Uncoated Steel	High
--------------------------------------	------

Depth to Restrictive Feature

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Sandy clay loam	0 cm	43 cm	A-6	CL, SC
H2	Sandy clay loam	43 cm	71 cm	A-6	CL, SC
H3	Sandy clay loam	71 cm	203 cm	A-6, A-7-6	CL, SC

Unnamed, minor components (20 percent)

Soils Descriptions TWDB Master Drainage Plan - SE(2)**AASHTO Classification Definitions**

A-1, A-1-a, A-1-b	Granular materials (35% or less passing No. 200 sieve), silt fragments, gravel and sand
A-2, A-2-4, A-2-5, A-2-6, A-2-7	Granular materials (35% or less passing No. 200 sieve), silty or clayey gravel and sand
A-3	Granular materials (35% or less passing No. 200 sieve), fine sand
A-4	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-5	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-7, A-7-5, A-7-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-8	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils

Unified Classification Definitions

CH	Fine-grained soils, silts and clays (liquid limit is 50% or more), Fat Clay
CL, CL-A (proposed), CL-K (proposed), CL-ML, CL-O (proposed), CL-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Lean Clay
GC, GC-GM	Coarse-grained soils, Gravels, gravel with fines, Clayey Gravel
GM	Coarse-grained soils, Gravels, gravel with fines, Silty Gravel
GP, GP-GC, GP-GM	Coarse-grained soils, Gravels, clean gravels, Poorly Graded Gravel
GW, GW-GC, GW-GM	Coarse-grained soils, Gravels, clean gravels, Well-Graded Gravel
MH, MH-A, MH-K, MH-O, MH-T	Fine-grained soils, silts and clays (liquid limit is 50% or more), Elastic Silt
ML, ML-A (proposed), ML-K (proposed), ML-O (proposed), ML-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Silt
OH, OH-T (proposed)	Fine-grained soils, silts and clays (liquid limit is 50% or more), Organic Clay or Organic Silt
OL	Fine-grained soils, silts and clays (liquid limit is less than 50%), Organic Clay or Organic Silt
PT	Highly organic soils, Peat
SC, SC-SM	Coarse-grained soils, Sands, sands with fines, Clayey Sand
SM	Coarse-grained soils, Sands, sands with fines, Silty Sand
SP, SP-SC, SP-SM	Coarse-grained soils, Sands, clean sands, Poorly Graded Sand
SW, SW-SC, SW-SM	Coarse-grained soils, Sands, clean sands, Well-Graded Sand

Disclaimer

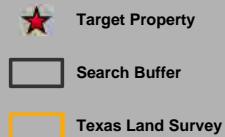

This Soils Survey from Banks Environmental Data, Inc. has searched Natural Resources Conservation Service (NRCS) and the Soil Survey Geographic Database (SSURGO). All soil data presented on the map and in the details section are based on information obtained from NRCS. Although Banks performs quality assurance and quality control on all data, inaccuracies of the data and mapped locations could possibly be traced to the source. Banks Environmental Data, Inc. cannot fully guarantee the accuracy of the SSURGO database maintained by NRCS.

This well scan searched for state and federal wells currently digitized in our geospatial database. No wells were found, but more wells could exist within the search area.

Source

U.S. Geological Survey, Texas Water Development Board (GW and Submitted Driller's Report), Texas Commission of Environmental Quality (PWS), Railroad Commission of Texas (Production Data)

Disclaimer

This well scan from Banks Environmental Data, Inc. has included a digital search of state and federal wells currently digitized in our geospatial database. Since this scan includes only well data that is currently mapped in our geospatial database, more wells could exist within the search area. For a complete well search or to locate more details, please contact Banks to obtain a full Water Well Report or Oil & Gas Well/Pipeline Search Report. More detailed individual well records can also be obtained from Banks for an additional cost, please reference a Well ID # from this well scan.

All well locations are based on information obtained from state and federal sources. Although Banks performs quality assurance and quality control on all data, inaccuracies of the records and mapped locations could possibly be traced to the specific regulatory authority or individual well driller. Banks Environmental Data, Inc. cannot fully guarantee the accuracy of the data or well location(s) of the maps and records maintained by the state and federal agencies.

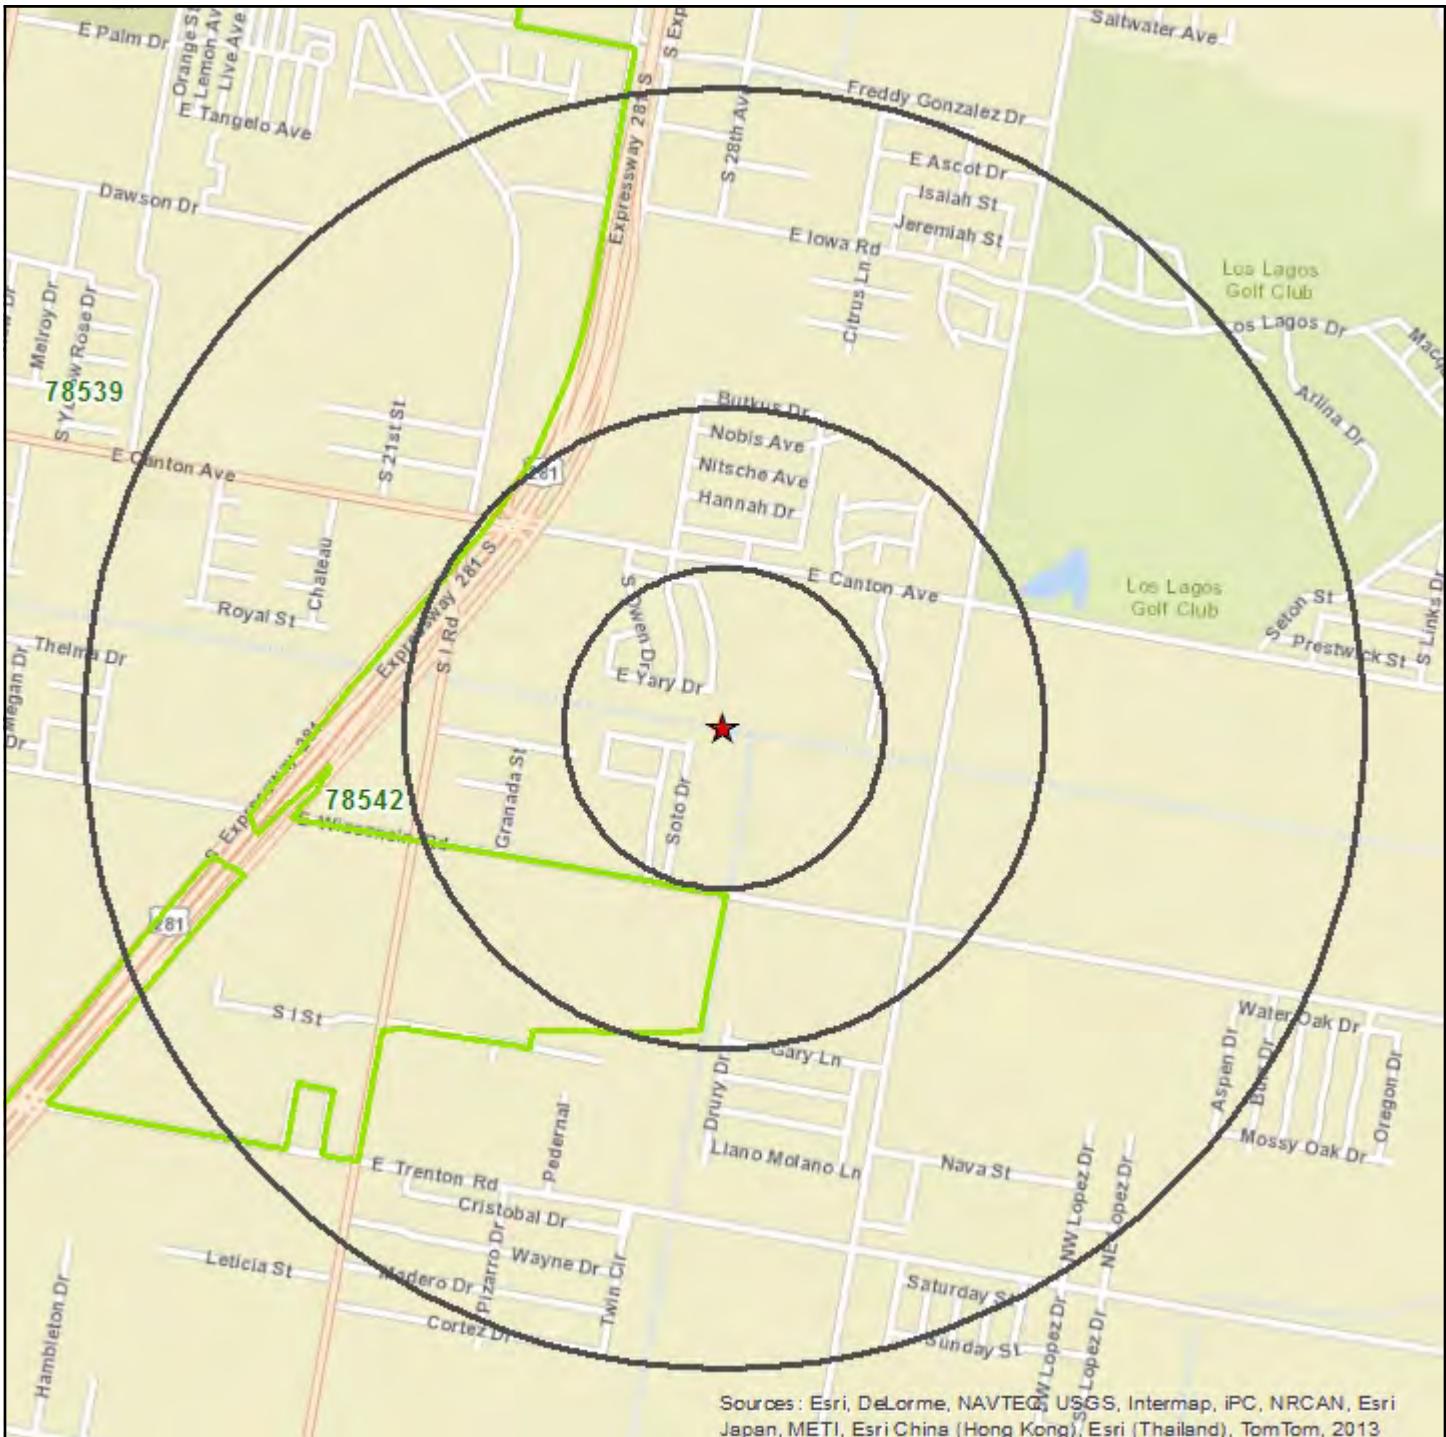

Banks Environmental Data performed a thorough search and no mapped sites were found.

Dataset Descriptions and Sources TWDB Master Drainage Plan - SE(2)

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
NPL -- National Priority List	EPA	NPL is the list of high priority hazardous waste sites in the United States eligible for long-term remedial action financed under the federal Superfund program and CERCLIS. Also known as Superfund sites, the EPA will only add sites to the NPL list based upon completion of the Hazard Ranking System (HRS) screening, public solicitation of comments about the proposed site, and after all comments have been addressed.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
DNPL -- Delisted National Priority List	EPA	DNPL is a list of all sites that have been deleted from the EPA NPL list. These sites are taken off the NPL list usually due to no further response or remedial action being required on them. Notices to delete NPL sites are published in the Federal Register and become effective unless the EPA receives significant adverse or critical comments during the 30-day public comment period.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER -- CERCLIS	EPA	CERCLIS sites come from the Comprehensive Environmental Response, Compensation, and Liability Act, a federal law designed to clean up abandoned hazardous waste sites. These sites are either proposed, listed or under review currently to be a part of the National Priority List.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER NFRAP -- CERCLIS NFRAP	EPA	CERCLIS sites designated 'No Further Remedial Action Planned' NFRAP have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the site being placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
RCRA COR -- RCRA CORRACTS	EPA	These sites are registered hazardous waste generators or handlers that fall under the Resource Conservation and Recovery Act (RCRA). and subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA TSD -- RCRA non-CORRACTS TSD	EPA	This database lists all treatment, storage and disposal of hazardous material sites that fall under the Resource Conservation and Recovery Act (RCRA). All hazardous waste TSD facilities are required to notify EPA of their existence.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA GEN -- RCRA Generators	EPA	The EPA regulates all Hazardous Waste Generators subject to the Resource Conservation and Recovery Act (RCRA). They are classified by the quantity of hazardous waste generated. A Small Quantity Generator (SQG) generates between 100kg and 1,000 kg of waste per month. A Large Quantity Generator (LQG) generates over 1,000 kg of waste per month. A Conditionally Exempt SQG (CEG) generates less than 100 kg of waste per month.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
FED BWN -- Federal Brownfields	EPA	A listing of sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that is either abandoned or underutilized where redevelopment or expansion is complicated by real or perceived environmental contamination.	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED IC -- Federal Institutional Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use. ICs are meant to supplement Engineering Controls and will rarely be the sole remedy at a site. ICs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED EC -- Federal Engineering Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination. ECs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - SE(2)

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
ERNS -- ERNS List	EPA/National Response Center	ERNS is a national database used to store information on unauthorized releases of oil and hazardous substances that have been reported to the National Response Center since 2001. The NRC is the sole federal point of contact for reporting oil and chemical spills. Prior to 2001 this information was maintained by the EPA.	Annually	01/11/2013	01/18/2013	01/18/2013	12/31/2012
ST NPL -- State/Tribal Equivalent NPL	TCEQ	This database contains sites determined by the TCEQ that may constitute an imminent and substantial endangerment to public health and safety or to the environment due to a release or threatened release of hazardous substances into the environment.	Quarterly	11/05/2013	11/06/2013	11/06/2013	11/06/2013
ST CER -- State/Tribal Equivalent CERCLIS	NA	This database is not currently available from this state. If this state does make this database available in the future, Banks Environmental Data will obtain it for reporting purposes.	NA	N/A	N/A	N/A	N/A
SWLF -- State/Tribal Disposal or Landfill	TCEQ	The SWLF database contains records of municipal solid waste facilities that may accept various types of municipal solid waste for processing or disposal, depending on the type of facility. A Municipal Solid Waste facility may also accept certain special wastes and non-hazardous industrial solid wastes if approved by the TCEQ executive director.	Quarterly	01/07/2014	01/07/2014	01/07/2014	01/03/2014
SWLF -- State/Tribal Disposal or Landfill	TCEQ	This database is a listing of closed and abandoned municipal solid waste landfills. The sites included are either unauthorized (UNUM_) or permitted (PERMAPP_).	NA	N/A	N/A	N/A	N/A
LPST -- State/Tribal Leaking Storage Tank	TCEQ	This database contains information on leaking storage tanks, equipment failures, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
LPST -- State/Tribal Leaking Storage Tank	EPA	The Tribal LUST database (maintained by EPA Region 6) provides information on leaking underground storage tank on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
PST -- State/Tribal Storage Tank	TCEQ	This database contains information on above and underground storage tanks, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
PST -- State/Tribal Storage Tank	EPA	The Tribal UST database (maintained by EPA Region 6) provides underground storage tank information on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
ST IC -- State/Tribal Institutional Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
ST IC -- State/Tribal Institutional Control	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST EC -- State/Tribal Engineering Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - SE(2)

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
VCP -- State/Tribal Voluntary Cleanup	TCEQ	This database contains sites from both the Voluntary Cleanup Program (VCP) and the Innocent Operator Program (IOP). The VCP records contain information on contaminated sites that private parties have cleaned up through assistance from the State in the form of administrative, technical, and legal incentives. The IOP records are sites that have received certificates from the State acknowledging that their property is contaminated as a result of a release or migration of contaminants from a source or sources not located on the property, and they did not cause or contribute to the source or sources of contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
VCP -- State/Tribal Voluntary Cleanup	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST BWN -- State/Tribal Brownfield	TCEQ	Brownfield sites are former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. In Texas, the TCEQ, in close partnership with the EPA and other federal, state, and local redevelopment agencies, and stakeholders, is facilitating cleanup, transferability, and revitalization of Brownfield's through the development of regulatory, tax, and technical assistance tools.	Quarterly	11/18/2013	11/18/2013	11/19/2013	11/04/2013
ST BWN -- State/Tribal Brownfield	RRC	The Railroad Commission of Texas' Voluntary Cleanup Program (RRC-VCP) provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination. Applicants to the program receive a release of liability to the state in exchange for a successful cleanup.	Quarterly	11/08/2013	11/13/2013	11/19/2013	11/13/2013
HW -- State/Tribal Hazardous Waste	TCEQ	This database contains information on facilities which store, process, or dispose of hazardous waste as maintained by the Industrial and Hazardous Waste Permits section of the TCEQ.	Quarterly	11/08/2013	11/13/2013	11/13/2013	10/05/2013
RCRA -- RCRA	EPA	This database lists all sites that fall under the Resource Conservation and Recovery Act (RCRA) and are not classifiable as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
DRYC -- Dry Cleaners	TCEQ	Dry Cleaner data houses both the DCRP Program information and PERC information released by the TCEQ. The DCRP database contains records funded for state-lead clean up of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. There are two listings from this program: LIST#1 - A historic listing of any facility that registered with the DCRP indicating whether or not the facility has used Perchloroethylene (PERC) in the past. LIST#2 - A Prioritization list of dry cleaner sites Facilities on this list will be investigated in order to determine the existence and/or extent of possible contamination. Facilities which are not current on their DCRP payments get dropped from the program. Banks Environmental Data DOES NOT REMOVE these listings from our database so that we may present a more complete historical listing of facilities that may or may not have used PERC in the past.	Quarterly	11/05/2013	11/06/2013	11/07/2013	11/06/2013

Disclaimer TWDB Master Drainage Plan - SE(2)

The Banks Environmental Data Regulatory Database Report was prepared based upon data obtained from State, Tribal, and Federal sources known to Banks Environmental Data at the time the data was obtained. Great care has been taken by Banks in obtaining the best available data from the best available sources. However, there is a possibility that there are sources of data applicable or pertaining to this report's target property, and/or surrounding properties, to which Banks does not have access or has not accessed. Furthermore, although Banks Environmental Data performs quality assurance and quality control on all data, including data it obtains, Banks recognizes that inaccuracies in data from these sources may, and do, exist; accordingly, inaccurate data may have been used or relied upon in the preparation of this report. Even though Banks Environmental Data performs a thorough and diligent search to locate and fix any inaccuracies in the data relied upon in the preparation of this report and this report, Banks cannot guarantee or warrant the accuracy of the locations, information, data, or report. The purchaser of this report accepts this report "as is" and assumes all risk related to any potential inaccuracy contained in the report or not reported in it, whether due to a reliance by Banks Environmental Data on inaccurate data, or for any other reason [including but not limited to the negligence or express negligence of Banks Environmental Data]. If this report is being used for the Records Review section of a Phase I Site Assessment according to the ASTM 1527-13, for EPA's All Appropriate Inquiry, or for any other purpose (public or private), all liability and responsibility is assumed by the Environmental Professional or other individual or entity acquiring the report.

Soil Type Descriptions**25 - Hidalgo fine sandy loam, 0 to 1 percent slopes**

Hydric Status	0
----------------------	---

Minimum Depth to Bedrock**Hidalgo (80 percent)**

Hydrologic Group	Moderately low runoff potential
-------------------------	---------------------------------

Soil Drainage Class	Well drained
----------------------------	--------------

Corrosion Potential - Uncoated Steel	High
---	------

Depth to Restrictive Feature

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Fine sandy loam	0 cm	43 cm	A-4, A-6	SC, SC-SM, SM
H2	Sandy clay loam	43 cm	71 cm	A-6	CL, SC
H3	Sandy clay loam	71 cm	203 cm	A-6, A-7-6	CL, SC

Unnamed, minor components (20 percent)**28 - Hidalgo sandy clay loam, 0 to 1 percent slopes**

Hydric Status	0
----------------------	---

Minimum Depth to Bedrock**Hidalgo (80 percent)**

Hydrologic Group	Moderately low runoff potential
-------------------------	---------------------------------

Soil Drainage Class	Well drained
----------------------------	--------------

Corrosion Potential - Uncoated Steel	High
---	------

Depth to Restrictive Feature

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Sandy clay loam	0 cm	43 cm	A-6	CL, SC
H2	Sandy clay loam	43 cm	71 cm	A-6	CL, SC
H3	Sandy clay loam	71 cm	203 cm	A-6, A-7-6	CL, SC

Unnamed, minor components (20 percent)**3 - Brennan fine sandy loam, 0 to 1 percent slopes**

Hydric Status	0
----------------------	---

Minimum Depth to Bedrock**Brennan (85 percent)**

Hydrologic Group	Moderately low runoff potential
-------------------------	---------------------------------

Soil Drainage Class	Well drained
----------------------------	--------------

Corrosion Potential - Uncoated Steel	Moderate
---	----------

Depth to Restrictive Feature

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Fine sandy loam	0 cm	33 cm	A-2-4, A-4	SC, SC-SM, SM
H2	Sandy clay loam	33 cm	165 cm	A-2-4, A-2-6, A-4, A-6	CL, SC

Unnamed, minor components (15 percent)**31 - Hidalgo-Urban land complex, 0 to 3 percent slopes**

Hydric Status	0
----------------------	---

Minimum Depth to Bedrock

Soils TWDB Master Drainage Plan - SW**Hidalgo (50 percent)**

Hydrologic Group	Moderately low runoff potential
Soil Drainage Class	Well drained
Corrosion Potential - Uncoated Steel	High
Depth to Restrictive Feature	

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Fine sandy loam	0 cm	43 cm	A-4, A-6	SC, SC-SM, SM
H2	Sandy clay loam	43 cm	71 cm	A-6	CL, SC
H3	Sandy clay loam	71 cm	203 cm	A-6, A-7-6	CL, SC

Urban land (30 percent)

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Variable	0 cm	102 cm		

Unnamed, minor components (20 percent)**52 - Raymondville clay loam, 0 to 1 percent slopes**

Hydric Status	0
----------------------	---

Minimum Depth to Bedrock**Raymondville (85 percent)**

Hydrologic Group	Moderately high runoff potential
Soil Drainage Class	Moderately well drained
Corrosion Potential - Uncoated Steel	High
Depth to Restrictive Feature	

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Clay loam	0 cm	38 cm	A-6, A-7-6	CL
H2	Clay loam	38 cm	109 cm	A-6, A-7-6	CH, CL
H3	Clay	109 cm	165 cm	A-7-6	CH, CL

Unnamed, minor components (15 percent)**60 - Rio clay loam**

Hydric Status	95
----------------------	----

Minimum Depth to Bedrock**Rio (87 percent)**

Hydrologic Group	Moderately high runoff potential when drained and high runoff potential undrained
Soil Drainage Class	Somewhat poorly drained
Corrosion Potential - Uncoated Steel	High
Depth to Restrictive Feature	

Horizon	Soil Texture	Upper Boundary	Lower Boundary	AASHTO	Unified
H1	Clay loam	0 cm	30 cm	A-6, A-7	CL
H2	Clay	30 cm	97 cm	A-7-6	CH, CL
H3	Clay loam	97 cm	160 cm	A-7-6	CL

Tiocano (8 percent)

Hydrologic Group	
Soil Drainage Class	Somewhat poorly drained
Corrosion Potential - Uncoated Steel	
Depth to Restrictive Feature	

Unnamed, minor components (5 percent)**W - Water**

Hydric Status	0
Minimum Depth to Bedrock	

Water (100 percent)

Soils Descriptions TWDB Master Drainage Plan - SW**AASHTO Classification Definitions**

A-1, A-1-a, A-1-b	Granular materials (35% or less passing No. 200 sieve), silt fragments, gravel and sand
A-2, A-2-4, A-2-5, A-2-6, A-2-7	Granular materials (35% or less passing No. 200 sieve), silty or clayey gravel and sand
A-3	Granular materials (35% or less passing No. 200 sieve), fine sand
A-4	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-5	Silt-Clay materials (more than 35% passing No. 200 sieve), silty soils
A-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-7, A-7-5, A-7-6	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils
A-8	Silt-Clay materials (more than 35% passing No. 200 sieve), clayey soils

Unified Classification Definitions

CH	Fine-grained soils, silts and clays (liquid limit is 50% or more), Fat Clay
CL, CL-A (proposed), CL-K (proposed), CL-ML, CL-O (proposed), CL-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Lean Clay
GC, GC-GM	Coarse-grained soils, Gravels, gravel with fines, Clayey Gravel
GM	Coarse-grained soils, Gravels, gravel with fines, Silty Gravel
GP, GP-GC, GP-GM	Coarse-grained soils, Gravels, clean gravels, Poorly Graded Gravel
GW, GW-GC, GW-GM	Coarse-grained soils, Gravels, clean gravels, Well-Graded Gravel
MH, MH-A, MH-K, MH-O, MH-T	Fine-grained soils, silts and clays (liquid limit is 50% or more), Elastic Silt
ML, ML-A (proposed), ML-K (proposed), ML-O (proposed), ML-T (proposed)	Fine-grained soils, silts and clays (liquid limit is less than 50%), Silt
OH, OH-T (proposed)	Fine-grained soils, silts and clays (liquid limit is 50% or more), Organic Clay or Organic Silt
OL	Fine-grained soils, silts and clays (liquid limit is less than 50%), Organic Clay or Organic Silt
PT	Highly organic soils, Peat
SC, SC-SM	Coarse-grained soils, Sands, sands with fines, Clayey Sand
SM	Coarse-grained soils, Sands, sands with fines, Silty Sand
SP, SP-SC, SP-SM	Coarse-grained soils, Sands, clean sands, Poorly Graded Sand
SW, SW-SC, SW-SM	Coarse-grained soils, Sands, clean sands, Well-Graded Sand

Disclaimer

This well scan from Banks Environmental Data, Inc. has included a digital search of state and federal wells currently digitized in our geospatial database. Since this scan includes only well data that is currently mapped in our geospatial database, more wells could exist within the search area. For a complete well search or to locate more details, please contact Banks to obtain a full Water Well Report or Oil & Gas Well/Pipeline Search Report. More detailed individual well records can also be obtained from Banks for an additional cost, please reference a Well ID # from this well scan.

All well locations are based on information obtained from state and federal sources. Although Banks performs quality assurance and quality control on all data, inaccuracies of the records and mapped locations could possibly be traced to the specific regulatory authority or individual well driller. Banks Environmental Data, Inc. cannot fully guarantee the accuracy of the data or well location(s) of the maps and records maintained by the state and federal agencies.

Dataset Descriptions and Sources TWDB Master Drainage Plan - SW

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
NPL -- National Priority List	EPA	NPL is the list of high priority hazardous waste sites in the United States eligible for long-term remedial action financed under the federal Superfund program and CERCLIS. Also known as Superfund sites, the EPA will only add sites to the NPL list based upon completion of the Hazard Ranking System (HRS) screening, public solicitation of comments about the proposed site, and after all comments have been addressed.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
DNPL -- Delisted National Priority List	EPA	DNPL is a list of all sites that have been deleted from the EPA NPL list. These sites are taken off the NPL list usually due to no further response or remedial action being required on them. Notices to delete NPL sites are published in the Federal Register and become effective unless the EPA receives significant adverse or critical comments during the 30-day public comment period.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER -- CERCLIS	EPA	CERCLIS sites come from the Comprehensive Environmental Response, Compensation, and Liability Act, a federal law designed to clean up abandoned hazardous waste sites. These sites are either proposed, listed or under review currently to be a part of the National Priority List.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
CER NFRAP -- CERCLIS NFRAP	EPA	CERCLIS sites designated 'No Further Remedial Action Planned' NFRAP have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the site being placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.	Quarterly	07/18/2013	11/05/2013	11/05/2013	10/25/2013
RCRA COR -- RCRA CORRACTS	EPA	These sites are registered hazardous waste generators or handlers that fall under the Resource Conservation and Recovery Act (RCRA). and subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA TSD -- RCRA non-CORRACTS TSD	EPA	This database lists all treatment, storage and disposal of hazardous material sites that fall under the Resource Conservation and Recovery Act (RCRA). All hazardous waste TSD facilities are required to notify EPA of their existence.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
RCRA GEN -- RCRA Generators	EPA	The EPA regulates all Hazardous Waste Generators subject to the Resource Conservation and Recovery Act (RCRA). They are classified by the quantity of hazardous waste generated. A Small Quantity Generator (SQG) generates between 100kg and 1,000 kg of waste per month. A Large Quantity Generator (LQG) generates over 1,000 kg of waste per month. A Conditionally Exempt SQG (CEG) generates less than 100 kg of waste per month.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
FED BWN -- Federal Brownfields	EPA	A listing of sites that assist the EPA in collecting, tracking, and updating information of sites in relation to the Small Business Liability Relief and Brownfields Revitalization Act. These sites are real property that is either abandoned or underutilized where redevelopment or expansion is complicated by real or perceived environmental contamination.	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED IC -- Federal Institutional Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use. ICs are meant to supplement Engineering Controls and will rarely be the sole remedy at a site. ICs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013
FED EC -- Federal Engineering Control	EPA	This is a listing of Brownfield Management System (BMS) sites that have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination. ECs are a type of Activity and Use Limitation (AUL).	Quarterly	11/05/2013	11/12/2013	11/12/2013	11/05/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - SW

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
ERNS -- ERNS List	EPA/National Response Center	ERNS is a national database used to store information on unauthorized releases of oil and hazardous substances that have been reported to the National Response Center since 2001. The NRC is the sole federal point of contact for reporting oil and chemical spills. Prior to 2001 this information was maintained by the EPA.	Annually	01/11/2013	01/18/2013	01/18/2013	12/31/2012
ST NPL -- State/Tribal Equivalent NPL	TCEQ	This database contains sites determined by the TCEQ that may constitute an imminent and substantial endangerment to public health and safety or to the environment due to a release or threatened release of hazardous substances into the environment.	Quarterly	11/05/2013	11/06/2013	11/06/2013	11/06/2013
ST CER -- State/Tribal Equivalent CERCLIS	NA	This database is not currently available from this state. If this state does make this database available in the future, Banks Environmental Data will obtain it for reporting purposes.	NA	N/A	N/A	N/A	N/A
SWLF -- State/Tribal Disposal or Landfill	TCEQ	The SWLF database contains records of municipal solid waste facilities that may accept various types of municipal solid waste for processing or disposal, depending on the type of facility. A Municipal Solid Waste facility may also accept certain special wastes and non-hazardous industrial solid wastes if approved by the TCEQ executive director.	Quarterly	01/07/2014	01/07/2014	01/07/2014	01/03/2014
SWLF -- State/Tribal Disposal or Landfill	TCEQ	This database is a listing of closed and abandoned municipal solid waste landfills. The sites included are either unauthorized (UNUM_) or permitted (PERMAPP_).	NA	N/A	N/A	N/A	N/A
LPST -- State/Tribal Leaking Storage Tank	TCEQ	This database contains information on leaking storage tanks, equipment failures, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
LPST -- State/Tribal Leaking Storage Tank	EPA	The Tribal LUST database (maintained by EPA Region 6) provides information on leaking underground storage tank on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
PST -- State/Tribal Storage Tank	TCEQ	This database contains information on above and underground storage tanks, compliance, and releases in the state.	Quarterly	11/08/2013	11/08/2013	11/08/2013	11/07/2013
PST -- State/Tribal Storage Tank	EPA	The Tribal UST database (maintained by EPA Region 6) provides underground storage tank information on tribal lands in Louisiana, Arkansas, Oklahoma, New Mexico and Tribal Nations.	Quarterly	10/28/2013	10/30/2013	10/30/2013	10/30/2013
ST IC -- State/Tribal Institutional Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Institutional Controls (ICs) placed on them. ICs are administrative restrictions, such as legal controls, that help minimize the potential for human exposure to known contamination by ensuring appropriate land or resource use.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
ST IC -- State/Tribal Institutional Control	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST EC -- State/Tribal Engineering Control	TCEQ	This database includes Voluntary Cleanup Program (VCP) or Innocent Operator Program (IOP) sites that have been remediated and have had Engineering Controls (ECs) placed on them. ECs are physical methods or modifications put into place on a site to reduce or eliminate the possibility of human exposure to known contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013

Dataset Descriptions and Sources TWDB Master Drainage Plan - SW

Dataset	Source	Dataset Description	Update Schedule	Data Requested	Data Obtained	Data Updated	Source Updated
VCP -- State/Tribal Voluntary Cleanup	TCEQ	This database contains sites from both the Voluntary Cleanup Program (VCP) and the Innocent Operator Program (IOP). The VCP records contain information on contaminated sites that private parties have cleaned up through assistance from the State in the form of administrative, technical, and legal incentives. The IOP records are sites that have received certificates from the State acknowledging that their property is contaminated as a result of a release or migration of contaminants from a source or sources not located on the property, and they did not cause or contribute to the source or sources of contamination.	Quarterly	11/13/2013	11/18/2013	11/18/2013	11/04/2013
VCP -- State/Tribal Voluntary Cleanup	RRC	The Railroad Commission of Texas Voluntary Cleanup Program provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination.	Quarterly	11/08/2013	11/13/2013	11/18/2013	11/13/2013
ST BWN -- State/Tribal Brownfield	TCEQ	Brownfield sites are former industrial properties that lie dormant or underutilized due to liability associated with real or perceived contamination. In Texas, the TCEQ, in close partnership with the EPA and other federal, state, and local redevelopment agencies, and stakeholders, is facilitating cleanup, transferability, and revitalization of Brownfield's through the development of regulatory, tax, and technical assistance tools.	Quarterly	11/18/2013	11/18/2013	11/19/2013	11/04/2013
ST BWN -- State/Tribal Brownfield	RRC	The Railroad Commission of Texas' Voluntary Cleanup Program (RRC-VCP) provides an incentive to remediate Oil & Gas related pollution by participants as long as they did not cause or contribute to the contamination. Applicants to the program receive a release of liability to the state in exchange for a successful cleanup.	Quarterly	11/08/2013	11/13/2013	11/19/2013	11/13/2013
HW -- State/Tribal Hazardous Waste	TCEQ	This database contains information on facilities which store, process, or dispose of hazardous waste as maintained by the Industrial and Hazardous Waste Permits section of the TCEQ.	Quarterly	11/08/2013	11/13/2013	11/13/2013	10/05/2013
RCRA -- RCRA	EPA	This database lists all sites that fall under the Resource Conservation and Recovery Act (RCRA) and are not classifiable as treatment, storage, disposers of hazardous material, hazardous waste generator or subject to corrective action activity.	Quarterly	11/19/2013	11/19/2013	11/19/2013	11/14/2013
DRYC -- Dry Cleaners	TCEQ	Dry Cleaner data houses both the DCRP Program information and PERC information released by the TCEQ. The DCRP database contains records funded for state-lead clean up of dry cleaner related contaminated sites. The DCRP administers the Dry Cleaning Facility Release Fund to assist with remediation of contamination caused by dry cleaning solvents. There are two listings from this program: LIST#1 - A historic listing of any facility that registered with the DCRP indicating whether or not the facility has used Perchloroethylene (PERC) in the past. LIST#2 - A Prioritization list of dry cleaner sites Facilities on this list will be investigated in order to determine the existence and/or extent of possible contamination. Facilities which are not current on their DCRP payments get dropped from the program. Banks Environmental Data DOES NOT REMOVE these listings from our database so that we may present a more complete historical listing of facilities that may or may not have used PERC in the past.	Quarterly	11/05/2013	11/06/2013	11/07/2013	11/06/2013

Disclaimer TWDB Master Drainage Plan - SW

The Banks Environmental Data Regulatory Database Report was prepared based upon data obtained from State, Tribal, and Federal sources known to Banks Environmental Data at the time the data was obtained. Great care has been taken by Banks in obtaining the best available data from the best available sources. However, there is a possibility that there are sources of data applicable or pertaining to this report's target property, and/or surrounding properties, to which Banks does not have access or has not accessed. Furthermore, although Banks Environmental Data performs quality assurance and quality control on all data, including data it obtains, Banks recognizes that inaccuracies in data from these sources may, and do, exist; accordingly, inaccurate data may have been used or relied upon in the preparation of this report. Even though Banks Environmental Data performs a thorough and diligent search to locate and fix any inaccuracies in the data relied upon in the preparation of this report and this report, Banks cannot guarantee or warrant the accuracy of the locations, information, data, or report. The purchaser of this report accepts this report "as is" and assumes all risk related to any potential inaccuracy contained in the report or not reported in it, whether due to a reliance by Banks Environmental Data on inaccurate data, or for any other reason [including but not limited to the negligence or express negligence of Banks Environmental Data]. If this report is being used for the Records Review section of a Phase I Site Assessment according to the ASTM 1527-13, for EPA's All Appropriate Inquiry, or for any other purpose (public or private), all liability and responsibility is assumed by the Environmental Professional or other individual or entity acquiring the report.
